**Electrically-operated oil circuit breakers** should be operated from sources of constant potential, preferably a storage battery in the case of d-c operation. Control from exciter circuits is not recommended. In the case of a-c operation, a reliable source of power should be used. A Rectox® full-wave rectifier, which changes the alternating current of any commercial frequency into direct current, may be utilized for the operation of the standard solenoid type of circuit breaker mechanism. The d-c solenoid with Rectox provides a closing unit having few moving parts.

Standard control voltages and their range for electrically-operated oil circuit breakers, measured at the mechanism terminals for solenoid mechanisms, are as follows:

**table A: standard control voltages**

control voltage	operating range—volts	
	to close	to trip
<b>direct current</b>		
24	....	14 to 30
48		28 to 60
125	90 to 130	70 to 140
250	180 to 260	140 to 280
<b>alternating current (Rectox solenoid)</b>		
115	95 to 125	95 to 125 ▲
230	190 to 250	190 to 250 ▲

▲ D-c potential trip coils for use with Rectox solenoid-operated breakers have the same ratings as listed above for d-c solenoid-operated breakers.

The closing and tripping currents listed in tables B and C refer only to our standard solenoid mechanisms for d-c operation. The values given in tables B and C are not applicable to Rectox operation and the E-R value of the coil must be used in selecting the Rectox.

The tripping mechanism consists of a d-c magnet acting as a trigger which releases a latch permitting the breaker to open.

Coils for other than standard voltages with the same proportional operating range can be furnished on special order.

All currents given are actual values as would be recorded with an oscilloscope. On Westinghouse breakers, the current is cut off as soon as the breaker reaches the closed position, so the current does not rise to the full value that would be indicated by an ammeter or obtained by dividing the circuit voltage by the resistance of the coil.

**values listed for estimating purposes only:** The values listed in tables B and C for operating currents are subject to change and should be used for estimating purposes only.
