ADDENDUM

This addendum contains information that relates to the C60 Breaker Protection System, version 5.5x. This addendum lists a number of information items that appear in the instruction manual GEK-113408B (revision **S3**) but are not included in the current C60 operations.

The following functions and items are not yet available with the current version of the C60 relay:

• Signal sources SRC 5 and SRC 6.

Version 4.0x and higher releases of the C60 relay includes new hardware (CPU and CT/VT modules).

• The new CPU modules are specified with the following order codes: 9E, 9G, 9H, 9J, 9K, 9L, 9M, 9N, 9P, 9R, and 9S.

• The new CT/VT modules are specified with the following order codes: 8F, 8G, 8H, 8J 8L, 8M, 8N, 8R.

The following table maps the relationship between the old CPU and CT/VT modules to the newer versions:

MODULE	OLD	NEW	DESCRIPTION
CPU	9A	9E	RS485 and RS485 (Modbus RTU, DNP)
	9C	9G	RS485 and 10Base-F (Ethernet, Modbus TCP/IP, DNP)
	9D	9H	RS485 and redundant 10Base-F (Ethernet, Modbus TCP/IP, DNP)
	---	9J	RS485 and multi-mode ST 100Base-FX
	---	9K	RS485 and multi-mode ST redundant 100Base-FX
	---	9L	RS485 and single mode SC 100Base-FX
	---	9M	RS485 and single mode SC redundant 100Base-FX
	---	9N	RS485 and 10/100Base-T
	---	9P	RS485 and single mode ST 100Base-FX
	---	9R	RS485 and single mode ST redundant 100Base-FX
	---	9S	RS485 and six-port managed Ethernet switch
CT/VT	8A	8F	Standard 4CT/4VT
	8B	8G	Sensitive ground 4CT/4VT
	8C	8H	Standard 8CT
	8D	8J	Sensitive ground 8CT/8VT
	--	8L	Standard 4CT/4VT with enhanced diagnostics
	--	8M	Sensitive ground 4CT/4VT with enhanced diagnostics
	--	8N	Standard 8CT with enhanced diagnostics
	--	8R	Sensitive ground 8CT/8VT with enhanced diagnostics

The new CT/VT modules can only be used with the new CPUs (9E, 9G, 9H, 9J, 9K, 9L, 9M, 9N, 9P, 9R, and 9S), and the old CT/VT modules can only be used with the old CPU modules (9A, 9C, 9D). To prevent any hardware mismatches, the new CPU and CT/VT modules have blue labels and a warning sticker stating **"Attn.: Ensure CPU and DSP module label colors are the same!"**. In the event that there is a mismatch between the CPU and CT/VT module, the relay will not function and a **DSP ERROR** or **HARDWARE MISMATCH** error will be displayed.

All other input/output modules are compatible with the new hardware.

With respect to the firmware, firmware versions 4.0x and higher are only compatible with the new CPU and CT/VT modules. Previous versions of the firmware (3.4x and earlier) are only compatible with the older CPU and CT/VT modules.

Please read this chapter to help guide you through the initial setup of your new relay.

WARNING **CAUTION** **Before attempting to install or use the relay, it is imperative that all WARNINGS and CAUTIONS in this manual are reviewed to help prevent personal injury, equipment damage, and/or down-time.**

- Open the relay packaging and inspect the unit for physical damage.

- View the rear nameplate and verify that the correct model has been ordered.
Figure 1–1: REAR NAMEPLATE (EXAMPLE)

- Ensure that the following items are included:

  - Instruction manual
  - GE EnerVista CD (includes the EnerVista UR Setup software and manuals in PDF format)
  - mounting screws
  - registration card (attached as the last page of the manual)

- Fill out the registration form and return to GE Multilin (include the serial number located on the rear nameplate).

- For product information, instruction manual updates, and the latest software updates, please visit the GE Multilin website at http://www.GEmultilin.com.

NOTE **If there is any noticeable physical damage, or any of the contents listed are missing, please contact GE Multilin immediately.**

1

Historically, substation protection, control, and metering functions were performed with electromechanical equipment. This first generation of equipment was gradually replaced by analog electronic equipment, most of which emulated the single-function approach of their electromechanical precursors. Both of these technologies required expensive cabling and auxiliary equipment to produce functioning systems.

Recently, digital electronic equipment has begun to provide protection, control, and metering functions. Initially, this equipment was either single function or had very limited multi-function capability, and did not significantly reduce the cabling and auxiliary equipment required. However, recent digital relays have become quite multi-functional, reducing cabling and auxiliaries significantly. These devices also transfer data to central control facilities and Human Machine Interfaces using electronic communications. The functions performed by these products have become so broad that many users now prefer the term IED (Intelligent Electronic Device).

It is obvious to station designers that the amount of cabling and auxiliary equipment installed in stations can be even further reduced, to 20% to 70% of the levels common in 1990, to achieve large cost reductions. This requires placing even more functions within the IEDs.

Users of power equipment are also interested in reducing cost by improving power quality and personnel productivity, and as always, in increasing system reliability and efficiency. These objectives are realized through software which is used to perform functions at both the station and supervisory levels. The use of these systems is growing rapidly.

High speed communications are required to meet the data transfer rates required by modern automatic control and monitoring systems. In the near future, very high speed communications will be required to perform protection signaling with a performance target response time for a command signal between two IEDs, from transmission to reception, of less than 3 milliseconds. This has been established by the IEC 61850 standard.

IEDs with the capabilities outlined above will also provide significantly more power system data than is presently available, enhance operations and maintenance, and permit the use of adaptive system configuration for protection and control systems. This new generation of equipment must also be easily incorporated into automation systems, at both the station and enterprise levels. The GE Multilin Universal Relay (UR) has been developed to meet these goals.

a) UR BASIC DESIGN

The UR is a digital-based device containing a central processing unit (CPU) that handles multiple types of input and output signals. The UR can communicate over a local area network (LAN) with an operator interface, a programming device, or another UR device.
Figure 1–2: UR CONCEPT BLOCK DIAGRAM

The **CPU module** contains firmware that provides protection elements in the form of logic algorithms, as well as programmable logic gates, timers, and latches for control features.

Input elements accept a variety of analog or digital signals from the field. The UR isolates and converts these signals into logic signals used by the relay.

Output elements convert and isolate the logic signals generated by the relay into digital or analog signals that can be used to control field devices.

b) UR SIGNAL TYPES

The **contact inputs and outputs** are digital signals associated with connections to hard-wired contacts. Both 'wet' and 'dry' contacts are supported.

The **virtual inputs and outputs** are digital signals associated with UR-series internal logic signals. Virtual inputs include signals generated by the local user interface. The virtual outputs are outputs of FlexLogic™ equations used to customize the device. Virtual outputs can also serve as virtual inputs to FlexLogic™ equations.

The **analog inputs and outputs** are signals that are associated with transducers, such as Resistance Temperature Detectors (RTDs).

The **CT and VT inputs** refer to analog current transformer and voltage transformer signals used to monitor AC power lines. The UR-series relays support 1 A and 5 A CTs.

The **remote inputs and outputs** provide a means of sharing digital point state information between remote UR-series devices. The remote outputs interface to the remote inputs of other UR-series devices. Remote outputs are FlexLogic™ operands inserted into IEC 61850 GSSE and GOOSE messages.

The **direct inputs and outputs** provide a means of sharing digital point states between a number of UR-series IEDs over a dedicated fiber (single or multimode), RS422, or G.703 interface. No switching equipment is required as the IEDs are connected directly in a ring or redundant (dual) ring configuration. This feature is optimized for speed and intended for pilot-aided schemes, distributed logic applications, or the extension of the input/output capabilities of a single relay chassis.

1

c) UR SCAN OPERATION

The UR-series devices operate in a cyclic scan fashion. The device reads the inputs into an input status table, solves the logic program (FlexLogic™ equation), and then sets each output to the appropriate state in an output status table. Any resulting task execution is priority interrupt-driven.
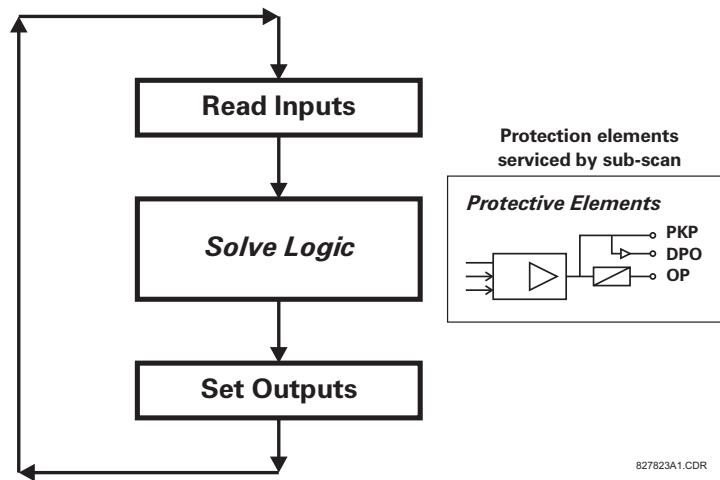

Figure 1–3: UR-SERIES SCAN OPERATION

1.2.3 SOFTWARE ARCHITECTURE

The firmware (software embedded in the relay) is designed in functional modules which can be installed in any relay as required. This is achieved with object-oriented design and programming (OOD/OOP) techniques.

Object-oriented techniques involve the use of *objects* and *classes*. An object is defined as "a logical entity that contains both data and code that manipulates that data". A class is the generalized form of similar objects. By using this concept, one can create a protection class with the protection elements as objects of the class, such as time overcurrent, instantaneous overcurrent, current differential, undervoltage, overvoltage, underfrequency, and distance. These objects represent completely self-contained software modules. The same object-class concept can be used for metering, input/output control, hmi, communications, or any functional entity in the system.

Employing OOD/OOP in the software architecture of the C60 achieves the same features as the hardware architecture: modularity, scalability, and flexibility. The application software for any UR-series device (for example, feeder protection, transformer protection, distance protection) is constructed by combining objects from the various functionality classes. This results in a *common look and feel* across the entire family of UR-series platform-based applications.

1.2.4 IMPORTANT CONCEPTS

As described above, the architecture of the UR-series relays differ from previous devices. To achieve a general understanding of this device, some sections of Chapter 5 are quite helpful. The most important functions of the relay are contained in "elements". A description of the UR-series elements can be found in the *Introduction to elements* section in chapter 5. Examples of simple elements, and some of the organization of this manual, can be found in the *Control elements* section of chapter 5. An explanation of the use of inputs from CTs and VTs is in the *Introduction to AC sources* section in chapter 5. A description of how digital signals are used and routed within the relay is contained in the *Introduction to FlexLogic™* section in chapter 5.

The faceplate keypad and display or the EnerVista UR Setup software interface can be used to communicate with the relay. The EnerVista UR Setup software interface is the preferred method to edit settings and view actual values because the PC monitor can display more information in a simple comprehensible format.

The following minimum requirements must be met for the EnerVista UR Setup software to properly operate on a PC.

- Pentium class or higher processor (Pentium II 300 MHz or higher recommended)
- Windows 95, 98, 98SE, ME, NT 4.0 (Service Pack 4 or higher), 2000, XP
- Internet Explorer 4.0 or higher
- 128 MB of RAM (256 MB recommended)
- 200 MB of available space on system drive and 200 MB of available space on installation drive
- Video capable of displaying 800 x 600 or higher in high-color mode (16-bit color)
- RS232 and/or Ethernet port for communications to the relay

The following qualified modems have been tested to be compliant with the C60 and the EnerVista UR Setup software.

- US Robotics external 56K FaxModem 5686
- US Robotics external Sportster 56K X2
- PCTEL 2304WT V.92 MDC internal modem

After ensuring the minimum requirements for using EnerVista UR Setup are met (see previous section), use the following procedure to install the EnerVista UR Setup from the enclosed GE EnerVista CD.

1. Insert the GE EnerVista CD into your CD-ROM drive.
2. Click the **Install Now** button and follow the installation instructions to install the no-charge EnerVista software.
3. When installation is complete, start the EnerVista Launchpad application.
4. Click the **IED Setup** section of the **Launch Pad** window.

5. In the EnerVista Launch Pad window, click the **Add Product** button and select the "C60 Breaker Protection System" from the Install Software window as shown below. Select the "Web" option to ensure the most recent software release, or select "CD" if you do not have a web connection, then click the **Add Now** button to list software items for the C60.
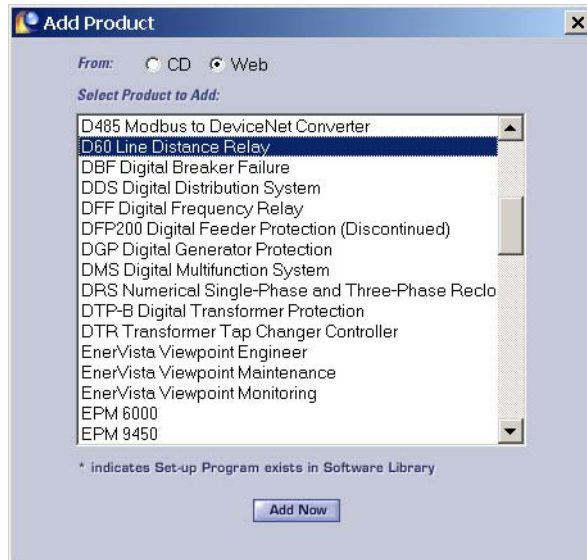

6. EnerVista Launchpad will obtain the software from the Web or CD and automatically start the installation program.

7. Select the complete path, including the new directory name, where the EnerVista UR Setup will be installed.

8. Click on **Next** to begin the installation. The files will be installed in the directory indicated and the installation program will automatically create icons and add EnerVista UR Setup to the Windows start menu.

9. Click **Finish** to end the installation. The UR-series device will be added to the list of installed IEDs in the EnerVista Launchpad window, as shown below.

1

a) OVERVIEW

The user can connect remotely to the C60 through the rear RS485 port or the rear Ethernet port with a PC running the EnerVista UR Setup software. The C60 can also be accessed locally with a laptop computer through the front panel RS232 port or the rear Ethernet port using the *Quick Connect* feature.

• To configure the C60 for remote access via the rear RS485 port(s), refer to the *Configuring Serial Communications* section.

• To configure the C60 for remote access via the rear Ethernet port, refer to the *Configuring Ethernet Communications* section. An Ethernet module must be specified at the time of ordering.

• To configure the C60 for local access with a laptop through either the front RS232 port or rear Ethernet port, refer to the *Using the Quick Connect Feature* section. An Ethernet module must be specified at the time of ordering for Ethernet communications.

b) CONFIGURING SERIAL COMMUNICATIONS

Before starting, verify that the serial cable is properly connected to the RS485 terminals on the back of the device. The faceplate RS232 port is intended for local use and is not described in this section; see the *Using the Quick Connect Feature* section for details on configuring the RS232 port.

A GE Multilin F485 converter (or compatible RS232-to-RS485 converter) is will be required. Refer to the F485 instruction manual for additional details.

1. Verify that the latest version of the EnerVista UR Setup software is installed (available from the GE EnerVista CD or online from http://www.GEmultilin.com). See the *Software Installation* section for installation details.

2. Select the "UR" device from the EnerVista Launchpad to start EnerVista UR Setup.

3. Click the **Device Setup** button to open the Device Setup window and click the **Add Site** button to define a new site.

4. Enter the desired site name in the "Site Name" field. If desired, a short description of site can also be entered along with the display order of devices defined for the site. In this example, we will use "Location 1" as the site name. Click the **OK** button when complete.

5. The new site will appear in the upper-left list in the EnerVista UR Setup window. Click the **Device Setup** button then select the new site to re-open the Device Setup window.

6. Click the **Add Device** button to define the new device.

7. Enter the desired name in the "Device Name" field and a description (optional) of the site.

1

8. Select "Serial" from the **Interface** drop-down list. This will display a number of interface parameters that must be entered for proper serial communications.
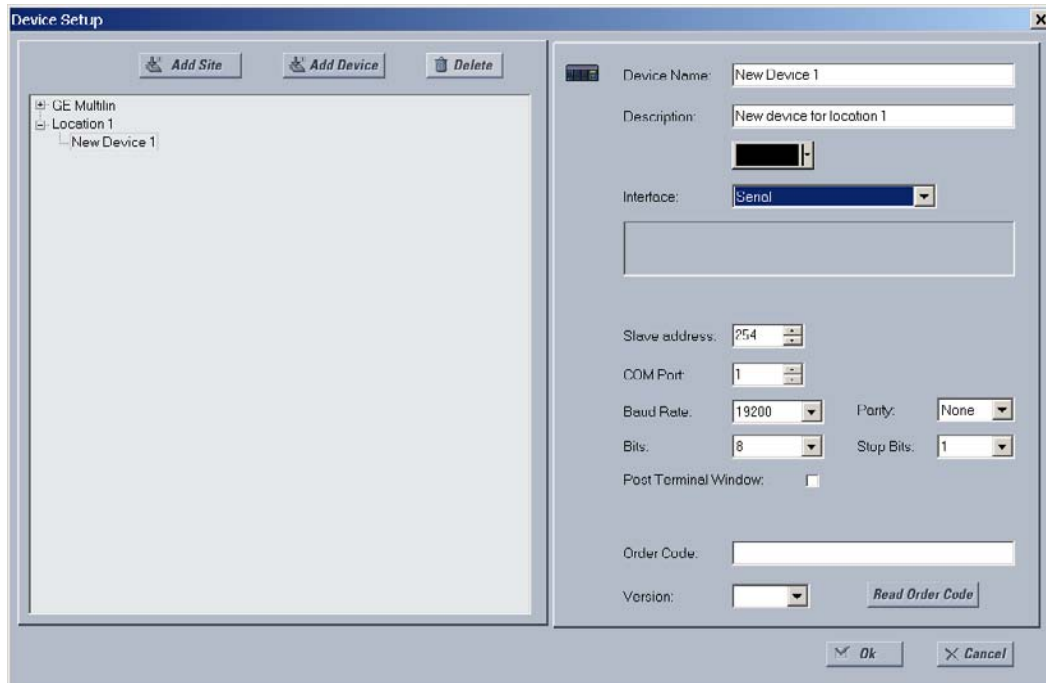

Figure 1–4: CONFIGURING SERIAL COMMUNICATIONS

9. Enter the relay slave address, COM port, baud rate, and parity settings from the **SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COM-MUNICATIONS ⇨⇩ SERIAL PORTS** menu in their respective fields.

10. Click the **Read Order Code** button to connect to the C60 device and upload the order code. If an communications error occurs, ensure that the EnerVista UR Setup serial communications values entered in the previous step correspond to the relay setting values.

11. Click "OK" when the relay order code has been received. The new device will be added to the Site List window (or Online window) located in the top left corner of the main EnerVista UR Setup window.

The Site Device has now been configured for RS232 communications. Proceed to the *Connecting to the C60* section to begin communications.

c) CONFIGURING ETHERNET COMMUNICATIONS

Before starting, verify that the Ethernet network cable is properly connected to the Ethernet port on the back of the relay. To setup the relay for Ethernet communications, it will be necessary to define a Site, then add the relay as a Device at that site.

1. Verify that the latest version of the EnerVista UR Setup software is installed (available from the GE EnerVista CD or online from http://www.GEmultilin.com). See the *Software Installation* section for installation details.

2. Select the "UR" device from the EnerVista Launchpad to start EnerVista UR Setup.

3. Click the **Device Setup** button to open the Device Setup window, then click the **Add Site** button to define a new site.

4. Enter the desired site name in the "Site Name" field. If desired, a short description of site can also be entered along with the display order of devices defined for the site. In this example, we will use "Location 2" as the site name. Click the **OK** button when complete.

5. The new site will appear in the upper-left list in the EnerVista UR Setup window. Click the **Device Setup** button then select the new site to re-open the Device Setup window.

6. Click the **Add Device** button to define the new device.

7. Enter the desired name in the "Device Name" field and a description (optional) of the site.

8. Select "Ethernet" from the **Interface** drop-down list. This will display a number of interface parameters that must be entered for proper Ethernet functionality.
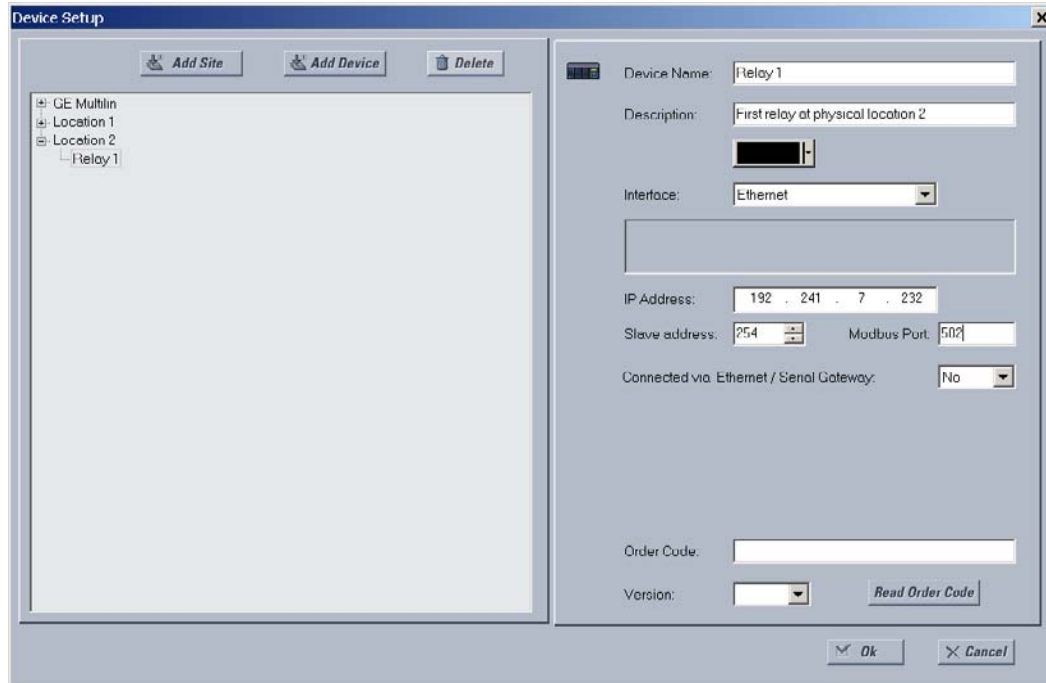

Figure 1–5: CONFIGURING ETHERNET COMMUNICATIONS

9. Enter the relay IP address specified in the **SETTINGS** ⇨ **PRODUCT SETUP** ⇨⇩ **COMMUNICATIONS** ⇨⇩ **NETWORK** ⇨ **IP ADDRESS**) in the "IP Address" field.

10. Enter the relay slave address and Modbus port address values from the respective settings in the **SETTINGS** ⇨ **PRODUCT SETUP** ⇨⇩ **COMMUNICATIONS** ⇨⇩ **MODBUS PROTOCOL** menu.

11. Click the **Read Order Code** button to connect to the C60 device and upload the order code. If an communications error occurs, ensure that the three EnerVista UR Setup values entered in the previous steps correspond to the relay setting values.

12. Click **OK** when the relay order code has been received. The new device will be added to the Site List window (or Online window) located in the top left corner of the main EnerVista UR Setup window.

The Site Device has now been configured for Ethernet communications. Proceed to the *Connecting to the C60* section to begin communications.

1.3.4 USING THE QUICK CONNECT FEATURE

a) USING QUICK CONNECT VIA THE FRONT PANEL RS232 PORT

Before starting, verify that the serial cable is properly connected from the laptop computer to the front panel RS232 port with a straight-through 9-pin to 9-pin RS232 cable.

1. Verify that the latest version of the EnerVista UR Setup software is installed (available from the GE EnerVista CD or online from http://www.GEmultilin.com). See the *Software Installation* section for installation details.

2. Select the "UR" device from the EnerVista Launchpad to start EnerVista UR Setup.

1

3. Click the **Quick Connect** button to open the Quick Connect dialog box.
4. Select the **Serial** interface and the correct COM Port, then click **Connect**.

5. The EnerVista UR Setup software will create a site named "Quick Connect" with a corresponding device also named "Quick Connect" and display them on the upper-left corner of the screen. Expand the sections to view data directly from the C60 device.

Each time the EnerVista UR Setup software is initialized, click the **Quick Connect** button to establish direct communications to the C60. This ensures that configuration of the EnerVista UR Setup software matches the C60 model number.

b) USING QUICK CONNECT VIA THE REAR ETHERNET PORTS

To use the Quick Connect feature to access the C60 from a laptop through Ethernet, first assign an IP address to the relay from the front panel keyboard.

1. Press the MENU key until the SETTINGS menu is displayed.

2. Navigate to the **SETTINGS** ⇨ **PRODUCT SETUP** ⇨⇩ **COMMUNICATIONS** ⇨⇩ **NETWORK** ⇨ **IP ADDRESS** setting.

3. Enter an IP address of "1.1.1.1" and select the ENTER key to save the value.

4. In the same menu, select the **SUBNET IP MASK** setting.

5. Enter a subnet IP address of "255.0.0.0" and press the ENTER key to save the value.

Next, use an Ethernet cross-over cable to connect the laptop to the rear Ethernet port. The pinout for an Ethernet cross-over cable is shown below.

END 1				END 2		
Pin	Wire color	Diagram		Pin	Wire color	Diagram
1	White/orange			1	White/green	
2	Orange			2	Green	
3	White/green			3	White/orange	
4	Blue			4	Blue	
5	White/blue			5	White/blue	
6	Green			6	Orange	
7	White/brown			7	White/brown	
8	Brown			8	Brown	
842799A1.CDR

Figure 1–6: ETHERNET CROSS–OVER CABLE PIN LAYOUT

Now, assign the laptop computer an IP address compatible with the relay's IP address.

1. From the Windows desktop, right-click the **My Network Places** icon and select **Properties** to open the network connections window.
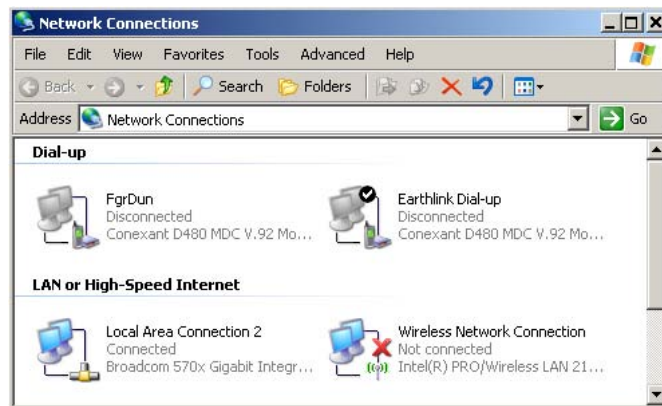

2. Right-click the **Local Area Connection** icon and select **Properties**.
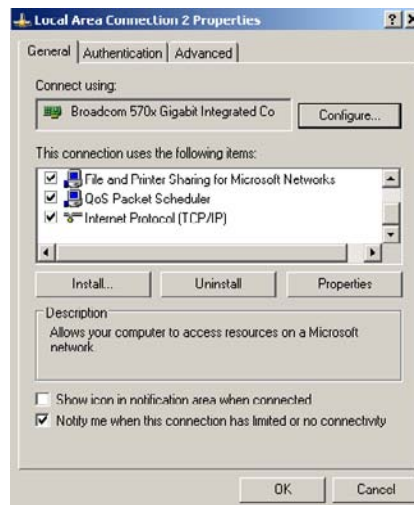

3. Select the **Internet Protocol (TCP/IP)** item from the list provided and click the **Properties** button.
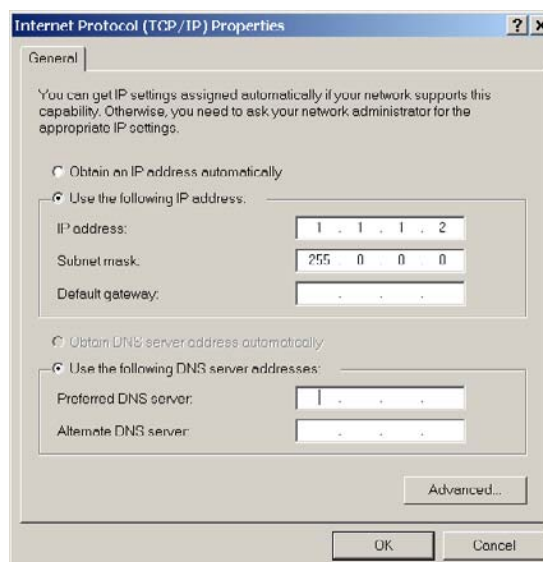

4. Click on the "Use the following IP address" box.

1

5. Enter an **IP address** with the first three numbers the same as the IP address of the C60 relay and the last number different (in this example, 1.1.1.2).

6. Enter a subnet mask equal to the one set in the C60 (in this example, 255.0.0.0).

7. Click OK to save the values.

Before continuing, it will be necessary to test the Ethernet connection.

1. Open a Windows console window by selecting **Start > Run** from the Windows Start menu and typing "cmd".

2. Type the following command:

    `C:\WINNT>ping 1.1.1.1`

3. If the connection is successful, the system will return four replies as follows:

    ```
    Pinging 1.1.1.1 with 32 bytes of data:

    Reply from 1.1.1.1: bytes=32 time<10ms TTL=255
    Reply from 1.1.1.1: bytes=32 time<10ms TTL=255
    Reply from 1.1.1.1: bytes=32 time<10ms TTL=255
    Reply from 1.1.1.1: bytes=32 time<10ms TTL=255

    Ping statistics for 1.1.1.1:
        Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip time in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0 ms
    ```

4. Note that the values for `time` and TTL will vary depending on local network configuration.

If the following sequence of messages appears when entering the `C:\WINNT>ping 1.1.1.1` command:

    ```
    Pinging 1.1.1.1 with 32 bytes of data:

    Request timed out.
    Request timed out.
    Request timed out.
    Request timed out.

    Ping statistics for 1.1.1.1:
        Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
    Approximate round trip time in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0 ms

    Pinging 1.1.1.1 with 32 bytes of data:
    ```

Verify the physical connection between the C60 and the laptop computer, and double-check the programmed IP address in the **PRODUCT SETUP** ⇨⇩ **COMMUNICATIONS** ⇨⇩ **NETWORK** ⇨ **IP ADDRESS** setting, then repeat step 2 in the above procedure.

If the following sequence of messages appears when entering the `C:\WINNT>ping 1.1.1.1` command:

    ```
    Pinging 1.1.1.1 with 32 bytes of data:

    Hardware error.
    Hardware error.
    Hardware error.
    Hardware error.

    Ping statistics for 1.1.1.1:
        Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
    Approximate round trip time in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0 ms

    Pinging 1.1.1.1 with 32 bytes of data:
    ```

Verify the physical connection between the C60 and the laptop computer, and double-check the programmed IP address in the **PRODUCT SETUP** ⇨⇩ **COMMUNICATIONS** ⇨⇩ **NETWORK** ⇨ **IP ADDRESS** setting, then repeat step 2 in the above procedure.

If the following sequence of messages appears when entering the `C:\WINNT>ping 1.1.1.1` command:

1

```
Pinging 1.1.1.1 with 32 bytes of data:

Destination host unreachable.
Destination host unreachable.
Destination host unreachable.
Destination host unreachable.

Ping statistics for 1.1.1.1:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
Approximate round trip time in milli-seconds:
    Minimum = 0ms, Maximum = 0ms, Average = 0 ms

Pinging 1.1.1.1 with 32 bytes of data:
```

Verify the IP address is programmed in the local PC by entering the ipconfig command in the command window.

```
C:\WINNT>ipconfig

Windows 2000 IP Configuration

Ethernet adapter <F4FE223E-5EB6-4BFB-9E34-1BD7BE7F59FF>:

        Default Gateway . . . . . . . . . :

C:\WINNT>
```

It may be necessary to restart the laptop for the change in IP address to take effect (Windows 98 or NT).

Before using the Quick Connect feature through the Ethernet port, it is necessary to disable any configured proxy settings in Internet Explorer.

1.   Start the Internet Explorer software.

2.   Select the **Tools > Internet Options** menu item and click on **Connections** tab.

3.   Click on the **LAN Settings** button to open the following window.

4.   Ensure that the "Use a proxy server for your LAN" box is not checked.

If this computer is used to connect to the Internet, re-enable any proxy server settings after the laptop has been disconnected from the C60 relay.

1.   Verify that the latest version of the EnerVista UR Setup software is installed (available from the GE enerVista CD or online from http://www.GEmultilin.com). See the *Software Installation* section for installation details.

2.   Start the Internet Explorer software.

1

3. Select the "UR" device from the EnerVista Launchpad to start EnerVista UR Setup.

4. Click the **Quick Connect** button to open the Quick Connect dialog box.
5. Select the **Ethernet** interface and enter the IP address assigned to the C60, then click **Connect**.

6. The EnerVista UR Setup software will create a site named "Quick Connect" with a corresponding device also named "Quick Connect" and display them on the upper-left corner of the screen. Expand the sections to view data directly from the C60 device.

Each time the EnerVista UR Setup software is initialized, click the **Quick Connect** button to establish direct communications to the C60. This ensures that configuration of the EnerVista UR Setup software matches the C60 model number.

When direct communications with the C60 via Ethernet is complete, make the following changes:

1. From the Windows desktop, right-click the **My Network Places** icon and select **Properties** to open the network connections window.

2. Right-click the **Local Area Connection** icon and select the **Properties** item.

3. Select the **Internet Protocol (TCP/IP)** item from the list provided and click the **Properties** button.

4. Set the computer to "Obtain a relay address automatically" as shown below.
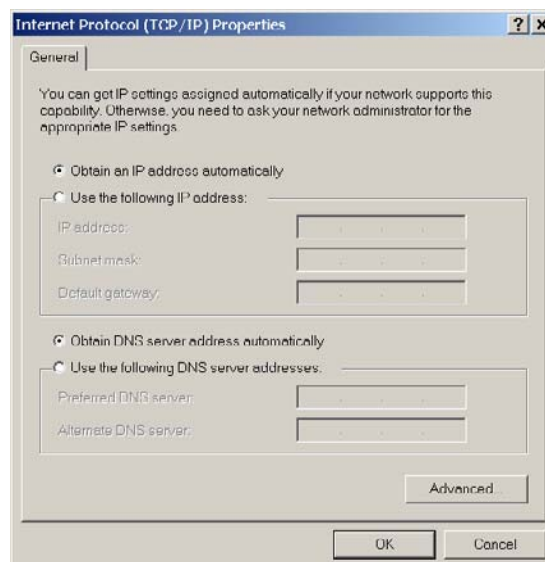

If this computer is used to connect to the Internet, re-enable any proxy server settings after the laptop has been disconnected from the C60 relay.

AUTOMATIC DISCOVERY OF ETHERNET DEVICES

The EnerVista UR Setup software can automatically discover and communicate to all UR-series IEDs located on an Ethernet network.

Using the Quick Connect feature, a single click of the mouse will trigger the software to automatically detect any UR-series relays located on the network. The EnerVista UR Setup software will then proceed to configure all settings and order code options in the **Device Setup** menu, for the purpose of communicating to multiple relays. This feature allows the user to identify and interrogate, in seconds, all UR-series devices in a particular location.

1. Open the Display Properties window through the Site List tree as shown below:

842743A3.CDR
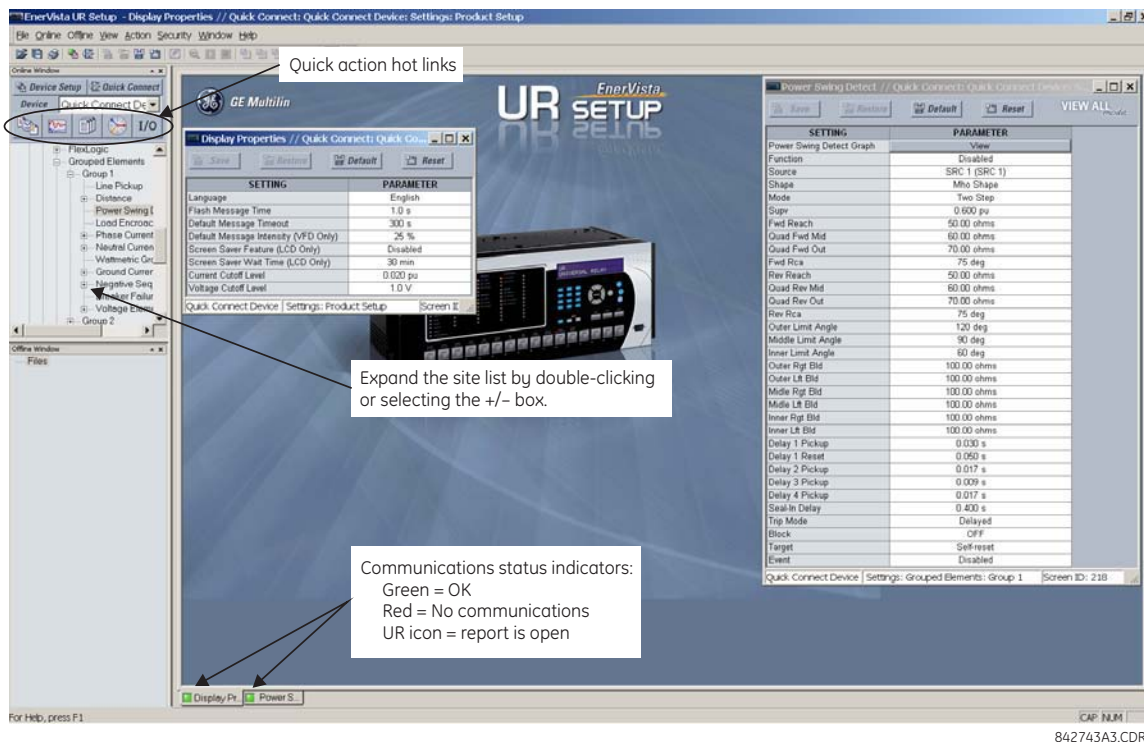

2. The Display Properties window will open with a status indicator on the lower left of the EnerVista UR Setup window.

3. If the status indicator is red, verify that the Ethernet network cable is properly connected to the Ethernet port on the back of the relay and that the relay has been properly setup for communications (steps A and B earlier).

    If a relay icon appears in place of the status indicator, than a report (such as an oscillography or event record) is open. Close the report to re-display the green status indicator.

4. The Display Properties settings can now be edited, printed, or changed according to user specifications.

    NOTE
    Refer to chapter 4 in this manual and the EnerVista UR Setup Help File for more information about the using the EnerVista UR Setup software interface.

QUICK ACTION HOT LINKS

The EnerVista UR Setup software has several new quick action buttons that provide users with instant access to several functions that are often performed when using C60 relays. From the online window, users can select which relay to interrogate from a pull-down window, then click on the button for the action they wish to perform. The following quick action functions are available:

• View the C60 event record.

• View the last recorded oscillography record.

• View the status of all C60 inputs and outputs.

• View all of the C60 metering values.

• View the C60 protection summary.

1

Please refer to Chapter 3: Hardware for detailed mounting and wiring instructions. Review all **WARNINGS** and **CAUTIONS** carefully.

The EnerVista UR Setup software communicates to the relay via the faceplate RS232 port or the rear panel RS485 / Ethernet ports. To communicate via the faceplate RS232 port, a standard *straight-through* serial cable is used. The DB-9 male end is connected to the relay and the DB-9 or DB-25 female end is connected to the PC COM1 or COM2 port as described in the *CPU communications ports* section of chapter 3.
Figure 1–7: RELAY COMMUNICATIONS OPTIONS

To communicate through the C60 rear RS485 port from a PC RS232 port, the GE Multilin RS232/RS485 converter box is required. This device (catalog number F485) connects to the computer using a "straight-through" serial cable. A shielded twisted-pair (20, 22, or 24 AWG) connects the F485 converter to the C60 rear communications port. The converter terminals (+, –, GND) are connected to the C60 communication module (+, –, COM) terminals. Refer to the *CPU communications ports* section in chapter 3 for option details. The line should be terminated with an R-C network (that is, 120 Ω, 1 nF) as described in the chapter 3.

All messages are displayed on a 2×20 backlit liquid crystal display (LCD) to make them visible under poor lighting conditions. Messages are descriptive and should not require the aid of an instruction manual for deciphering. While the keypad and display are not actively being used, the display will default to user-defined messages. Any high priority event driven message will automatically override the default message and appear on the display.

Display messages are organized into pages under the following headings: actual values, settings, commands, and targets. The MENU key navigates through these pages. Each heading page is broken down further into logical subgroups.

The MESSAGE keys navigate through the subgroups. The VALUE keys scroll increment or decrement numerical setting values when in programming mode. These keys also scroll through alphanumeric values in the text edit mode. Alternatively, values may also be entered with the numeric keypad.

The decimal key initiates and advance to the next character in text edit mode or enters a decimal point. The HELP key may be pressed at any time for context sensitive help messages. The ENTER key stores altered setting values.

1.5.2 MENU NAVIGATION

Press the MENU key to select the desired header display page (top-level menu). The header title appears momentarily followed by a header display page menu item. Each press of the MENU key advances through the following main heading pages:

* Actual values.

* Settings.

* Commands.

* Targets.

* User displays (when enabled).

1.5.3 MENU HIERARCHY

The setting and actual value messages are arranged hierarchically. The header display pages are indicated by double scroll bar characters (■■), while sub-header pages are indicated by single scroll bar characters (■). The header display pages represent the highest level of the hierarchy and the sub-header display pages fall below this level. The MESSAGE UP and DOWN keys move within a group of headers, sub-headers, setting values, or actual values. Continually pressing the MESSAGE RIGHT key from a header display displays specific information for the header category. Conversely, continually pressing the MESSAGE LEFT key from a setting value or actual value display returns to the header display.

HIGHEST LEVEL   **LOWEST LEVEL (SETTING VALUE)**

```

```

1.5.4 RELAY ACTIVATION

The relay is defaulted to the "Not Programmed" state when it leaves the factory. This safeguards against the installation of a relay whose settings have not been entered. When powered up successfully, the Trouble LED will be on and the In Service LED off. The relay in the "Not Programmed" state will block signaling of any output relay. These conditions will remain until the relay is explicitly put in the "Programmed" state.

Select the menu message **SETTINGS ⇨ PRODUCT SETUP ⇨⇩ INSTALLATION ⇨ RELAY SETTINGS**

```
RELAY SETTINGS:
Not Programmed
```

1

To put the relay in the "Programmed" state, press either of the VALUE keys once and then press ENTER. The faceplate Trouble LED will turn off and the In Service LED will turn on. The settings for the relay can be programmed manually (refer to *Chapter 5*) via the faceplate keypad or remotely (refer to the EnerVista UR Setup help file) via the EnerVista UR Setup software interface.

It is recommended that passwords be set up for each security level and assigned to specific personnel. There are two user password security access levels, COMMAND and SETTING:

1. COMMAND

The COMMAND access level restricts the user from making any settings changes, but allows the user to perform the following operations:

- operate breakers via faceplate keypad
- change state of virtual inputs
- clear event records
- clear oscillography records
- operate user-programmable pushbuttons

2. SETTING

The SETTING access level allows the user to make any changes to any of the setting values.

> **NOTE**
> **Refer to the *Changing Settings* section in Chapter 4 for complete instructions on setting up security level passwords.**

FlexLogic™ equation editing is required for setting up user-defined logic for customizing the relay operations. See the *FlexLogic™* section in Chapter 5 for additional details.

The C60 requires a minimum amount of maintenance when it is commissioned into service. Since the C60 is a microprocessor-based relay, its characteristics do not change over time. As such, no further functional tests are required.

Furthermore, the C60 performs a number of continual self-tests and takes the necessary action in case of any major errors (see the *Relay Self-tests* section in chapter 7 for details). However, it is recommended that C60 maintenance be scheduled with other system maintenance. This maintenance may involve the in-service, out-of-service, or unscheduled maintenance.

In-service maintenance:

1. Visual verification of the analog values integrity such as voltage and current (in comparison to other devices on the corresponding system).

2. Visual verification of active alarms, relay display messages, and LED indications.

3. LED test.

4. Visual inspection for any damage, corrosion, dust, or loose wires.

5. Event recorder file download with further events analysis.

Out-of-service maintenance:

1. Check wiring connections for firmness.

2. Analog values (currents, voltages, RTDs, analog inputs) injection test and metering accuracy verification. Calibrated test equipment is required.

3. Protection elements setting verification (analog values injection or visual verification of setting file entries against relay settings schedule).

4. Contact inputs and outputs verification. This test can be conducted by direct change of state forcing or as part of the system functional testing.

5. Visual inspection for any damage, corrosion, or dust.

6. Event recorder file download with further events analysis.

7. LED Test and pushbutton continuity check.

Unscheduled maintenance such as during a disturbance causing system interruption:

1. View the event recorder and oscillography or fault report for correct operation of inputs, outputs, and elements.

If it is concluded that the relay or one of its modules is of concern, contact GE Multilin for prompt service.

1

The C60 Breaker Protection System is a microprocessor based relay designed for breaker monitoring, control and protection.

Voltage, current, and power metering is built into the relay as a standard feature. Current parameters are available as total waveform RMS magnitude, or as fundamental frequency only RMS magnitude and angle (phasor).

Diagnostic features include an event recorder capable of storing 1024 time-tagged events, oscillography capable of storing up to 64 records with programmable trigger, content and sampling rate, and data logger acquisition of up to 16 channels, with programmable content and sampling rate. The internal clock used for time-tagging can be synchronized with an IRIG-B signal or via the SNTP protocol over the Ethernet port. This precise time stamping allows the sequence of events to be determined throughout the system. Events can also be programmed (via FlexLogic™ equations) to trigger oscillography data capture which may be set to record the measured parameters before and after the event for viewing on a personal computer (PC). These tools significantly reduce troubleshooting time and simplify report generation in the event of a system fault.

A faceplate RS232 port may be used to connect to a PC for the programming of settings and the monitoring of actual values. A variety of communications modules are available. Two rear RS485 ports allow independent access by operating and engineering staff. All serial ports use the Modbus® RTU protocol. The RS485 ports may be connected to system computers with baud rates up to 115.2 kbps. The RS232 port has a fixed baud rate of 19.2 kbps. Optional communications modules include a 10Base-F Ethernet interface which can be used to provide fast, reliable communications in noisy environments. Another option provides two 10Base-F fiber optic ports for redundancy. The Ethernet port supports IEC 61850, Modbus®/TCP, and TFTP protocols, and allows access to the relay via any standard web browser (C60 web pages). The IEC 60870-5-104 protocol is supported on the Ethernet port. DNP 3.0 and IEC 60870-5-104 cannot be enabled at the same time.

The C60 IEDs use flash memory technology which allows field upgrading as new features are added. The following *Single line diagram* illustrates the relay functionality using ANSI (American National Standards Institute) device numbers.

Table 2–1: ANSI DEVICE NUMBERS AND FUNCTIONS

DEVICE NUMBER	FUNCTION	DEVICE NUMBER	FUNCTION
25	Synchrocheck	50P BF	Phase Instantaneous Overcurrent, Breaker Failure
27P	Phase Undervoltage	51G	Ground Time Overcurrent
27X	Auxiliary Undervoltage	51N	Neutral Time Overcurrent
32	Sensitive Directional Power	51P	Phase Time Overcurrent
50DD	Disturbance detector	52	AC Circuit Breaker
50G	Ground Instantaneous Overcurrent	59N	Neutral Overvoltage
50N	Neutral Instantaneous Overcurrent	59X	Auxiliary Overvoltage

Disturbance Detection	Non-Volatile Latches	VT Fuse Failure

2.1.2 ORDERING

The C60 is available as a 19-inch rack horizontal mount unit or a reduced size (¾) vertical mount unit, and consists of the following modules: CPU, faceplate, power supply, CPU, CTs and VTs, digital input and outputs, transducer inputs and outputs, and inter-relay communications. Each of these modules can be supplied in a number of configurations specified at the time of ordering. The information required to completely specify the relay is provided in the following tables (see chapter 3 for full details of relay modules).

NOTE

Order codes are subject to change without notice. Refer to the GE Multilin ordering page at http://www.GEindustrial.com/multilin/order.htm for the latest details concerning C60 ordering options.

The order codes for the horizontal mount units are shown below.

Table 2–3: C60 ORDER CODES (HORIZONTAL UNITS)

																7W	RS422, 2 Channels

2.1.3 REPLACEMENT MODULES

Replacement modules can be ordered separately as shown below. When ordering a replacement CPU module or faceplate, please provide the serial number of your existing unit.

> **NOTE**
> Not all replacement modules may be applicable to the C60 relay. Only the modules specified in the order codes are available as replacement modules.

> **NOTE**
> Replacement module codes are subject to change without notice. Refer to the GE Multilin ordering page at http://www.GEindustrial.com/multilin/order.htm for the latest details concerning C60 ordering options.

The replacement module order codes for the horizontal mount units are shown below.

Table 2–5: ORDER CODES FOR REPLACEMENT MODULES, HORIZONTAL UNITS

	UR	-	**	-	*	
POWER SUPPLY			1H			125 / 250 V AC/DC
(redundant supply only available in horizontal units;			1L			24 to 48 V (DC only)
must be same type as main supply)			RH			redundant 125 / 250 V AC/DC
			RH			redundant 24 to 48 V (DC only)
CPU			9E			RS485 and RS485 (Modbus RTU, DNP 3.0)
			9G			RS485 and 10Base-F (Ethernet, Modbus TCP/IP, DNP 3.0)
			9H			RS485 and Redundant 10Base-F (Ethernet, Modbus TCP/IP, DNP 3.0)
			9J			RS485 and multi-mode ST 100Base-FX (Ethernet, Modbus TCP/IP, DNP 3.0)
			9K			RS485 and multi-mode ST redundant 100Base-FX (Ethernet, Modbus TCP/IP, DNP 3.0)
			9L			RS485 and single mode SC 100Base-FX (Ethernet, Modbus TCP/IP, DNP 3.0)
			9M			RS485 and single mode SC redundant 100Base-FX (Ethernet, Modbus TCP/IP, DNP 3.0)
			9N			RS485 and 10/100Base-T (Ethernet, Modbus TCP/IP, DNP 3.0)
			9P			RS485 and single mode ST 100Base-FX (Ethernet, Modbus TCP/IP, DNP 3.0)
			9R			RS485 and single mode ST redundant 100Base-FX (Ethernet, Modbus TCP/IP, DNP 3.0)
			9S			RS485 and six-port managed Ethernet switch
FACEPLATE/DISPLAY			3C			Horizontal faceplate with keypad and English display
			3D			Horizontal faceplate with keypad and French display
			3R			Horizontal faceplate with keypad and Russian display
			3A			Horizontal faceplate with keypad and Chinese display
			3P			Horizontal faceplate with keypad, user-programmable pushbuttons, and English display
			3G			Horizontal faceplate with keypad, user-programmable pushbuttons, and French display
			3S			Horizontal faceplate with keypad, user-programmable pushbuttons, and Russian display
			3B			Horizontal faceplate with keypad, user-programmable pushbuttons, and Chinese display
			3K			Enhanced front panel with English display
			3M			Enhanced front panel with French display
			3Q			Enhanced front panel with Russian display
			3U			Enhanced front panel with Chinese display
			3L			Enhanced front panel with English display and user-programmable pushbuttons
			3N			Enhanced front panel with French display and user-programmable pushbuttons
			3T			Enhanced front panel with Russian display and user-programmable pushbuttons
			3V			Enhanced front panel with Chinese display and user-programmable pushbuttons
DIGITAL INPUTS AND OUTPUTS			4A			4 Solid-State (no monitoring) MOSFET outputs
			4B			4 Solid-State (voltage with optional current) MOSFET outputs
			4C			4 Solid-State (current with optional voltage) MOSFET outputs
			4D			16 digital inputs with Auto-Burnishing
			4L			14 Form-A (no monitoring) Latching outputs
			67			8 Form-A (no monitoring) outputs
			6A			2 Form-A (voltage with optional current) and 2 Form-C outputs, 8 digital inputs
			6B			2 Form-A (voltage with optional current) and 4 Form-C outputs, 4 digital inputs
			6C			8 Form-C outputs
			6D			16 digital inputs
			6E			4 Form-C outputs, 8 digital inputs
			6F			8 Fast Form-C outputs
			6G			4 Form-A (voltage with optional current) outputs, 8 digital inputs
			6H			6 Form-A (voltage with optional current) outputs, 4 digital inputs
			6K			4 Form-C and 4 Fast Form-C outputs
			6L			2 Form-A (current with optional voltage) and 2 Form-C outputs, 8 digital inputs
			6M			2 Form-A (current with optional voltage) and 4 Form-C outputs, 4 digital inputs
			6N			4 Form-A (current with optional voltage) outputs, 8 digital inputs
			6P			6 Form-A (current with optional voltage) outputs, 4 digital inputs
			6R			2 Form-A (no monitoring) and 2 Form-C outputs, 8 digital inputs
			6S			2 Form-A (no monitoring) and 4 Form-C outputs, 4 digital inputs
			6T			4 Form-A (no monitoring) outputs, 8 digital inputs
			6U			6 Form-A (no monitoring) outputs, 4 digital inputs
CT/VT			8F			Standard 4CT/4VT
MODULES			8G			Sensitive Ground 4CT/4VT
(NOT AVAILABLE FOR THE C30)			8H			Standard 8CT
			8J			Sensitive Ground 8CT
			8L			Standard 4CT/4VT with enhanced diagnostics
			8M			Sensitive Ground 4CT/4VT with enhanced diagnostics
			8N			Standard 8CT with enhanced diagnostics
			8R			Sensitive Ground 8CT with enhanced diagnostics
INTER-RELAY COMMUNICATIONS			2A			C37.94SM, 1300nm single-mode, ELED, 1 channel single-mode
			2B			C37.94SM, 1300nm single-mode, ELED, 2 channel single-mode
			2E			Bi-phase, single channel
			2F			Bi-phase, dual channel
			2G			IEEE C37.94, 820 nm, 64 kbps, multimode, LED, 1 Channel
			2H			IEEE C37.94, 820 nm, 64 kbps, multimode, LED, 2 Channel
			2S			Six-port managed Ethernet switch with high voltage power supply (110 to 250 V DC / 100 to 240 V AC)
			2T			Six-port managed Ethernet switch with low voltage power supply (48 V DC)
			72			1550 nm, single-mode, LASER, 1 Channel
			73			1550 nm, single-mode, LASER, 2 Channel
			74			Channel 1 - RS422; Channel 2 - 1550 nm, single-mode, LASER
			75			Channel 1 - G.703; Channel 2 - 1550 nm, Single-mode LASER
			76			IEEE C37.94, 820 nm, multimode, LED, 1 Channel
			77			IEEE C37.94, 820 nm, multimode, LED, 2 Channels
			7A			820 nm, multi-mode, LED, 1 Channel
			7B			1300 nm, multi-mode, LED, 1 Channel
			7C			1300 nm, single-mode, ELED, 1 Channel
			7D			1300 nm, single-mode, LASER, 1 Channel
			7E			Channel 1 - G.703; Channel 2 - 820 nm, multi-mode
			7F			Channel 1 - G.703; Channel 2 - 1300 nm, multi-mode
			7G			Channel 1 - G.703; Channel 2 - 1300 nm, single-mode ELED
			7H			820 nm, multi-mode, LED, 2 Channels
			7I			1300 nm, multi-mode, LED, 2 Channels
			7J			1300 nm, single-mode, ELED, 2 Channels
			7K			1300 nm, single-mode, LASER, 2 Channels
			7L			Channel 1 - RS422; Channel 2 - 820 nm, multi-mode, LED
			7M			Channel 1 - RS422; Channel 2 - 1300 nm, multi-mode, LED
			7N			Channel 1 - RS422; Channel 2 - 1300 nm, single-mode, ELED
			7P			Channel 1 - RS422; Channel 2 - 1300 nm, single-mode, LASER
			7Q			Channel 1 - G.703; Channel 2 - 1300 nm, single-mode LASER
			7R			G.703, 1 Channel
			7S			G.703, 2 Channels
			7T			RS422, 1 Channel
			7W			RS422, 2 Channels
TRANSDUCER			5A			4 dcmA inputs, 4 dcmA outputs (only one 5A module is allowed)
INPUTS/OUTPUTS			5C			8 RTD inputs
			5D			4 RTD inputs, 4 dcmA outputs (only one 5D module is allowed)
			5E			4 dcmA inputs, 4 RTD inputs
			5F			8 dcmA inputs

The replacement module order codes for the reduced-size vertical mount units are shown below.

Table 2–6: ORDER CODES FOR REPLACEMENT MODULES, VERTICAL UNITS

	UR	-	**	-	*	
POWER SUPPLY			1H			125 / 250 V AC/DC
			1L			24 to 48 V (DC only)
CPU			9E			RS485 and RS485 (Modbus RTU, DNP 3.0)
			9G			RS485 and 10Base-F (Ethernet, Modbus TCP/IP, DNP 3.0)
			9H			RS485 and Redundant 10Base-F (Ethernet, Modbus TCP/IP, DNP 3.0)
			9J			RS485 and multi-mode ST 100Base-FX (Ethernet, Modbus TCP/IP, DNP 3.0)
			9K			RS485 and multi-mode ST redundant 100Base-FX (Ethernet, Modbus TCP/IP, DNP 3.0)
			9L			RS485 and single mode SC 100Base-FX (Ethernet, Modbus TCP/IP, DNP 3.0)
			9M			RS485 and single mode SC redundant 100Base-FX (Ethernet, Modbus TCP/IP, DNP 3.0)
			9N			RS485 and 10/100Base-T (Ethernet, Modbus TCP/IP, DNP 3.0)
			9P			RS485 and single mode ST 100Base-FX (Ethernet, Modbus TCP/IP, DNP 3.0)
			9R			RS485 and single mode ST redundant 100Base-FX (Ethernet, Modbus TCP/IP, DNP 3.0)
FACEPLATE/DISPLAY			3F			Vertical faceplate with keypad and English display
			3D			Vertical faceplate with keypad and French display
			3R			Vertical faceplate with keypad and Russian display
			3K			Vertical faceplate with keypad and Chinese display
			3K			Enhanced front panel with English display
			3M			Enhanced front panel with French display
			3Q			Enhanced front panel with Russian display
			3U			Enhanced front panel with Chinese display
			3L			Enhanced front panel with English display and user-programmable pushbuttons
			3N			Enhanced front panel with French display and user-programmable pushbuttons
			3T			Enhanced front panel with Russian display and user-programmable pushbuttons
			3V			Enhanced front panel with Chinese display and user-programmable pushbuttons
DIGITAL INPUTS/OUTPUTS			4A			4 Solid-State (no monitoring) MOSFET outputs
			4B			4 Solid-State (voltage with optional current) MOSFET outputs
			4C			4 Solid-State (current with optional voltage) MOSFET outputs
			4D			16 digital inputs with Auto-Burnishing
			4L			14 Form-A (no monitoring) Latching outputs
			67			8 Form-A (no monitoring) outputs
			6A			2 Form-A (voltage with optional current) and 2 Form-C outputs, 8 digital inputs
			6B			2 Form-A (voltage with optional current) and 4 Form-C outputs, 4 digital inputs
			6C			8 Form-C outputs
			6D			16 digital inputs
			6E			4 Form-C outputs, 8 digital inputs
			6F			8 Fast Form-C outputs
			6G			4 Form-A (voltage with optional current) outputs, 8 digital inputs
			6H			6 Form-A (voltage with optional current) outputs, 4 digital inputs
			6K			4 Form-C and 4 Fast Form-C outputs
			6L			2 Form-A (current with optional voltage) and 2 Form-C outputs, 8 digital inputs
			6M			2 Form-A (current with optional voltage) and 4 Form-C outputs, 4 digital inputs
			6N			4 Form-A (current with optional voltage) outputs, 8 digital inputs
			6P			6 Form-A (current with optional voltage) outputs, 8 digital inputs
			6R			2 Form-A (no monitoring) and 2 Form-C outputs, 8 digital inputs
			6S			2 Form-A (no monitoring) and 4 Form-C outputs, 4 digital inputs
			6T			4 Form-A (no monitoring) outputs, 8 digital inputs
			6U			6 Form-A (no monitoring) outputs, 4 digital inputs
CT/VT MODULES (NOT AVAILABLE FOR THE C30)			8F			Standard 4CT/4VT
			8G			Sensitive Ground 4CT/4VT
			8H			Standard 8CT
			8J			Sensitive Ground 8CT
			8L			Standard 4CT/4VT with enhanced diagnostics
			8M			Sensitive Ground 4CT/4VT with enhanced diagnostics
			8N			Standard 8CT with enhanced diagnostics
			8R			Sensitive Ground 8CT with enhanced diagnostics
INTER-RELAY COMMUNICATIONS			2A			C37.94SM, 1300nm single-mode, ELED, 1 channel single-mode
			2B			C37.94SM, 1300nm single-mode, ELED, 2 channel single-mode
			2E			Bi-phase, single channel
			2F			Bi-phase, dual channel
			2G			IEEE C37.94, 820 nm, 128 kbps, multimode, LED, 1 Channel
			2H			IEEE C37.94, 820 nm, 128 kbps, multimode, LED, 2 Channels

			5F			8 dcmA inputs

SPECIFICATIONS ARE SUBJECT TO CHANGE WITHOUT NOTICE

2.2.1 PROTECTION ELEMENTS

2

> **NOTE**
>
> The operating times below include the activation time of a trip rated form-A output contact unless otherwise indicated. FlexLogic™ operands of a given element are 4 ms faster. This should be taken into account when using FlexLogic™ to interconnect with other protection or control elements of the relay, building FlexLogic™ equations, or interfacing with other IEDs or power system devices via communications or different output contacts.

PHASE/NEUTRAL/GROUND TOC

Current:	Phasor or RMS
Pickup level:	0.000 to 30.000 pu in steps of 0.001
Dropout level:	97% to 98% of pickup
Level accuracy:	
for 0.1 to 2.0 × CT:	±0.5% of reading or ±0.4% of rated (whichever is greater)
for > 2.0 × CT:	±1.5% of reading > 2.0 × CT rating
Curve shapes:	IEEE Moderately/Very/Extremely Inverse; IEC (and BS) A/B/C and Short Inverse; GE IAC Inverse, Short/Very/Extremely Inverse; I^2t; FlexCurves™ (programmable); Definite Time (0.01 s base curve)
Curve multiplier:	Time Dial = 0.00 to 600.00 in steps of 0.01
Reset type:	Instantaneous/Timed (per IEEE)
Timing accuracy:	Operate at > 1.03 × actual pickup ±3.5% of operate time or ±½ cycle (whichever is greater)

PHASE/NEUTRAL/GROUND IOC

Pickup level:	0.000 to 30.000 pu in steps of 0.001
Dropout level:	97 to 98% of pickup
Level accuracy:	
0.1 to 2.0 × CT rating:	±0.5% of reading or ±0.4% of rated (whichever is greater)
> 2.0 × CT rating	±1.5% of reading
Overreach:	<2%
Pickup delay:	0.00 to 600.00 s in steps of 0.01
Reset delay:	0.00 to 600.00 s in steps of 0.01
Operate time:	<16 ms at 3 × pickup at 60 Hz (Phase/Ground IOC) <20 ms at 3 × pickup at 60 Hz (Neutral IOC)
Timing accuracy:	Operate at 1.5 × pickup ±3% or ±4 ms (whichever is greater)

SENSITIVE DIRECTIONAL POWER

Measured power:	3-phase, true RMS
Number of stages:	2
Characteristic angle:	0 to 359° in steps of 1
Calibration angle:	0.00 to 0.95° in steps of 0.05
Minimum power:	−1.200 to 1.200 pu in steps of 0.001
Pickup level accuracy:	±1% or ±0.001 pu, whichever is greater
Hysteresis:	2% or 0.001 pu, whichever is greater
Pickup delay:	0 to 600.00 s in steps of 0.01
Time accuracy:	±3% or ±4 ms, whichever is greater
Operate time:	50 ms

PHASE UNDERVOLTAGE

Pickup level:	0.000 to 3.000 pu in steps of 0.001
Dropout level:	102 to 103% of pickup
Level accuracy:	±0.5% of reading from 10 to 208 V
Curve shapes:	GE IAV Inverse; Definite Time (0.1s base curve)
Curve multiplier:	Time dial = 0.00 to 600.00 in steps of 0.01
Timing accuracy:	Operate at < 0.90 × pickup ±3.5% of operate time or ±4 ms (whichever is greater)

AUXILIARY UNDERVOLTAGE

Pickup level:	0.000 to 3.000 pu in steps of 0.001
Dropout level:	102 to 103% of pickup
Level accuracy:	±0.5% of reading from 10 to 208 V
Curve shapes:	GE IAV Inverse, Definite Time
Curve multiplier:	Time Dial = 0 to 600.00 in steps of 0.01
Timing accuracy:	±3% of operate time or ±4 ms (whichever is greater)

NEUTRAL OVERVOLTAGE

Pickup level:	0.000 to 3.000 pu in steps of 0.001
Dropout level:	97 to 98% of pickup
Level accuracy:	±0.5% of reading from 10 to 208 V
Pickup delay:	0.00 to 600.00 s in steps of 0.01 (definite time) or user-defined curve
Reset delay:	0.00 to 600.00 s in steps of 0.01
Timing accuracy:	±3% or ±20 ms (whichever is greater)
Operate time:	< 30 ms at 1.10 × pickup at 60 Hz

AUXILIARY OVERVOLTAGE

Pickup level:	0.000 to 3.000 pu in steps of 0.001
Dropout level:	97 to 98% of pickup
Level accuracy:	±0.5% of reading from 10 to 208 V
Pickup delay:	0 to 600.00 s in steps of 0.01
Reset delay:	0 to 600.00 s in steps of 0.01
Timing accuracy:	±3% of operate time or ±4 ms (whichever is greater)
Operate time:	< 30 ms at 1.10 × pickup at 60 Hz

BREAKER FAILURE

Mode:	1-pole, 3-pole
Current supervision:	phase, neutral current
Current supv. pickup:	0.001 to 30.000 pu in steps of 0.001
Current supv. dropout:	97 to 98% of pickup
Current supv. accuracy:	
0.1 to 2.0 × CT rating:	±0.75% of reading or ±2% of rated (whichever is greater)
above 2 × CT rating:	±2.5% of reading

2

BREAKER ARCING CURRENT

Principle:	accumulates breaker duty (I^2t) and measures fault duration
Initiation:	programmable per phase from any FlexLogic™ operand
Compensation for auxiliary relays:	0 to 65.535 s in steps of 0.001
Alarm threshold:	0 to 50000 kA2-cycle in steps of 1
Fault duration accuracy:	0.25 of a power cycle
Availability:	1 per CT bank with a minimum of 2

BREAKER FLASHOVER

Operating quantity:	phase current, voltage and voltage difference
Pickup level voltage:	0 to 1.500 pu in steps of 0.001
Dropout level voltage:	97 to 98% of pickup
Pickup level current:	0 to 1.500 pu in steps of 0.001
Dropout level current:	97 to 98% of pickup
Level accuracy:	±0.5% or ±0.1% of rated, whichever is greater
Pickup delay:	0 to 65.535 s in steps of 0.001
Time accuracy:	±3% or ±42 ms, whichever is greater
Operate time:	<42 ms at $1.10 \times$ pickup at 60 Hz

BREAKER RESTRIKE

Principle:	detection of high-frequency overcurrent condition ¼ cycle after breaker opens
Availability:	one per CT/VT module (not including 8Z modules)
Pickup level:	0.1 to 2.00 pu in steps of 0.01
Reset delay:	0.000 to 65.535 s in steps of 0.001

SYNCHROCHECK

Max voltage difference:	0 to 400000 V in steps of 1
Max angle difference:	0 to 100° in steps of 1
Max freq. difference:	0.00 to 2.00 Hz in steps of 0.01
Hysteresis for max. freq. diff.:	0.00 to 0.10 Hz in steps of 0.01
Dead source function:	None, LV1 & DV2, DV1 & LV2, DV1 or DV2, DV1 xor DV2, DV1 & DV2 (L = Live, D = Dead)

AUTORECLOSURE

Two breakers applications

Single- and three-pole tripping schemes

Up to 4 reclose attempts before lockout

Selectable reclosing mode and breaker sequence

TRIP BUS (TRIP WITHOUT FLEXLOGIC™)

Number of elements:	6
Number of inputs:	16
Operate time:	<2 ms at 60 Hz
Time accuracy:	±3% or 10 ms, whichever is greater

2.2.2 USER-PROGRAMMABLE ELEMENTS

FLEXLOGIC™

Programming language:	Reverse Polish Notation with graphical visualization (keypad programmable)
Lines of code:	512
Internal variables:	64
Supported operations:	NOT, XOR, OR (2 to 16 inputs), AND (2 to 16 inputs), NOR (2 to 16 inputs), NAND (2 to 16 inputs), latch (reset-dominant), edge detectors, timers
Inputs:	any logical variable, contact, or virtual input
Number of timers:	32
Pickup delay:	0 to 60000 (ms, sec., min.) in steps of 1
Dropout delay:	0 to 60000 (ms, sec., min.) in steps of 1

FLEXCURVES™

Number:	4 (A through D)
Reset points:	40 (0 through 1 of pickup)
Operate points:	80 (1 through 20 of pickup)
Time delay:	0 to 65535 ms in steps of 1

FLEX STATES

Number:	up to 256 logical variables grouped under 16 Modbus addresses
Programmability:	any logical variable, contact, or virtual input

FLEXELEMENTS™

Number of elements:	8
Operating signal:	any analog actual value, or two values in differential mode
Operating signal mode:	signed or absolute value
Operating mode:	level, delta
Comparator direction:	over, under
Pickup Level:	–90.000 to 90.000 pu in steps of 0.001
Hysteresis:	0.1 to 50.0% in steps of 0.1
Delta dt:	20 ms to 60 days
Pickup & dropout delay:	0.000 to 65.535 s in steps of 0.001

NON-VOLATILE LATCHES

Type:	set-dominant or reset-dominant
Number:	16 (individually programmed)
Output:	stored in non-volatile memory
Execution sequence:	as input prior to protection, control, and FlexLogic™

USER-PROGRAMMABLE LEDs

Number:	48 plus trip and alarm
Programmability:	from any logical variable, contact, or virtual input
Reset mode:	self-reset or latched

LED TEST

Initiation:	from any digital input or user-program-mable condition
Number of tests:	3, interruptible at any time
Duration of full test:	approximately 3 minutes
Test sequence 1:	all LEDs on
Test sequence 2:	all LEDs off, one LED at a time on for 1 s
Test sequence 3:	all LEDs on, one LED at a time off for 1 s

USER-DEFINABLE DISPLAYS

Number of displays:	16
Lines of display:	2×20 alphanumeric characters
Parameters:	up to 5, any Modbus register addresses
Invoking and scrolling:	keypad, or any user-programmable condition, including pushbuttons

CONTROL PUSHBUTTONS

Number of pushbuttons:	7
Operation:	drive FlexLogic™ operands

USER-PROGRAMMABLE PUSHBUTTONS (OPTIONAL)

Number of pushbuttons:	12 (standard faceplate); 16 (enhanced faceplate)
Mode:	self-reset, latched
Display message:	2 lines of 20 characters each
Drop-out timer:	0.00 to 60.00 s in steps of 0.05
Autoreset timer:	0.2 to 600.0 s in steps of 0.1
Hold timer:	0.0 to 10.0 s in steps of 0.1

SELECTOR SWITCH

Number of elements:	2
Upper position limit:	1 to 7 in steps of 1
Selecting mode:	time-out or acknowledge
Time-out timer:	3.0 to 60.0 s in steps of 0.1
Control inputs:	step-up and 3-bit
Power-up mode:	restore from non-volatile memory or synchronize to a 3-bit control input or synch/restore mode

2.2.3 MONITORING

OSCILLOGRAPHY

Maximum records:	64
Sampling rate:	64 samples per power cycle
Triggers:	any element pickup, dropout, or operate; digital input change of state; digital output change of state; FlexLogic™ equation
Data:	AC input channels; element state; digital input state; digital output state
Data storage:	in non-volatile memory

EVENT RECORDER

Capacity:	1024 events
Time-tag:	to 1 microsecond
Triggers:	any element pickup, dropout, or operate; digital input change of state; digital output change of state; self-test events
Data storage:	in non-volatile memory

DATA LOGGER

Number of channels:	1 to 16
Parameters:	any available analog actual value
Sampling rate:	15 to 3600000 ms in steps of 1
Trigger:	any FlexLogic™ operand
Mode:	continuous or triggered
Storage capacity:	(NN is dependent on memory)
	1-second rate:
	01 channel for NN days
	16 channels for NN days
	↓
	60-minute rate:
	01 channel for NN days
	16 channels for NN days

FAULT LOCATOR

Method:	single-ended
Voltage source:	wye-connected VTs, delta-connected VTs and neutral voltage, delta-connected VTs and zero-sequence current (approximation)
Maximum accuracy if:	fault resistance is zero or fault currents from all line terminals are in phase
Relay accuracy:	±1.5% (V > 10 V, I > 0.1 pu)
Worst-case accuracy:	
$VT_{\%error}$ +	user data
$CT_{\%error}$ +	user data
$Z_{Line\%error}$ +	user data
$METHOD_{\%error}$ +	see chapter 8
$RELAY\ ACCURACY_{\%error}$ +	(1.5%)

2

RMS CURRENT: PHASE, NEUTRAL, AND GROUND
Accuracy at
  0.1 to 2.0 × CT rating: ±0.25% of reading or ±0.1% of rated
                                    (whichever is greater)
  > 2.0 × CT rating: ±1.0% of reading

RMS VOLTAGE
Accuracy: ±0.5% of reading from 10 to 208 V

REAL POWER (WATTS)
Accuracy: ±1.0% of reading at
                             −0.8 < PF ≤ −1.0 and 0.8 < PF ≤ 1.0

REACTIVE POWER (VARS)
Accuracy: ±1.0% of reading at −0.2 ≤ PF ≤ 0.2

APPARENT POWER (VA)
Accuracy: ±1.0% of reading

WATT-HOURS (POSITIVE AND NEGATIVE)
Accuracy: ±2.0% of reading
Range: ±0 to 1×10^6 MWh
Parameters: three-phase only
Update rate: 50 ms

VAR-HOURS (POSITIVE AND NEGATIVE)
Accuracy: ±2.0% of reading
Range: ±0 to 1×10^6 Mvarh
Parameters: three-phase only
Update rate: 50 ms

FREQUENCY
Accuracy at
  V = 0.8 to 1.2 pu: ±0.001 Hz (when voltage signal is used
                                  for frequency measurement)
  I = 0.1 to 0.25 pu: ±0.05 Hz
  I > 0.25 pu: ±0.001 Hz (when current signal is used
                                  for frequency measurement)

DEMAND
Measurements: Phases A, B, and C present and maximum measured currents
                                 3-Phase Power (P, Q, and S) present and maximum measured currents
Accuracy: ±2.0%

AC CURRENT
CT rated primary: 1 to 50000 A
CT rated secondary: 1 A or 5 A by connection
Nominal frequency: 20 to 65 Hz
Relay burden: < 0.2 VA at rated secondary
Conversion range:
  Standard CT: 0.02 to 46 × CT rating RMS symmetrical
  Sensitive Ground CT module:
                         0.002 to 4.6 × CT rating RMS symmetrical
Current withstand: 20 ms at 250 times rated
                           1 sec. at 100 times rated
                           continuous at 3 times rated

AC VOLTAGE
VT rated secondary: 50.0 to 240.0 V
VT ratio: 1.00 to 24000.00
Nominal frequency: 20 to 65 Hz
Relay burden: < 0.25 VA at 120 V
Conversion range: 1 to 275 V
Voltage withstand: continuous at 260 V to neutral
                           1 min./hr at 420 V to neutral

CONTACT INPUTS
Dry contacts: 1000 Ω maximum
Wet contacts: 300 V DC maximum
Selectable thresholds: 17 V, 33 V, 84 V, 166 V
Tolerance: ±10%
Contacts per common return: 4
Recognition time: < 1 ms
Debounce time: 0.0 to 16.0 ms in steps of 0.5
Continuous current draw:3 mA (when energized)

CONTACT INPUTS WITH AUTO-BURNISHING
Dry contacts: 1000 Ω maximum
Wet contacts: 300 V DC maximum
Selectable thresholds: 17 V, 33 V, 84 V, 166 V
Tolerance: ±10%
Contacts per common return: 2
Recognition time: < 1 ms
Debounce time: 0.0 to 16.0 ms in steps of 0.5
Continuous current draw:3 mA (when energized)
Auto-burnish impulse current: 50 to 70 mA
Duration of auto-burnish impulse: 25 to 50 ms

DCMA INPUTS
Current input (mA DC):   0 to −1, 0 to +1, −1 to +1, 0 to 5, 0 to 10,
                              0 to 20, 4 to 20 (programmable)
Input impedance: 379 Ω ±10%
Conversion range: −1 to + 20 mA DC
Accuracy: ±0.2% of full scale
Type: Passive

RTD INPUTS
Types (3-wire):   100 Ω Platinum, 100 & 120 Ω Nickel, 10 Ω Copper
Sensing current: 5 mA
Range: −50 to +250°C
Accuracy: ±2°C
Isolation: 36 V pk-pk

IRIG-B INPUT
Amplitude modulation: 1 to 10 V pk-pk
DC shift: TTL
Input impedance: 22 kΩ
Isolation: 2 kV

2

REMOTE INPUTS (IEC 61850 GSSE/GOOSE)

Number of input points: 32, configured from 64 incoming bit pairs

Number of remote devices:16

Default states on loss of comms.: On, Off, Latest/Off, Latest/On

DIRECT INPUTS

Number of input points: 32

No. of remote devices: 16

Default states on loss of comms.: On, Off, Latest/Off, Latest/On

Ring configuration: Yes, No

Data rate: 64 or 128 kbps

CRC: 32-bit

CRC alarm:
  Responding to: Rate of messages failing the CRC
  Monitoring message count: 10 to 10000 in steps of 1
  Alarm threshold: 1 to 1000 in steps of 1

Unreturned message alarm:
  Responding to: Rate of unreturned messages in the ring
                   configuration
  Monitoring message count: 10 to 10000 in steps of 1
  Alarm threshold: 1 to 1000 in steps of 1

TELEPROTECTION

Number of input points: 16

No. of remote devices: 3

Default states on loss of comms.: On, Off, Latest/Off, Latest/On

Ring configuration: No

Data rate: 64 or 128 kbps

CRC: 32-bit

2.2.6 POWER SUPPLY

LOW RANGE

Nominal DC voltage: 24 to 48 V

Min/max DC voltage: 20 / 60 V

Voltage loss hold-up: 20 ms duration at nominal

NOTE: Low range is DC only.

HIGH RANGE

Nominal DC voltage: 125 to 250 V

Min/max DC voltage: 88 / 300 V

Nominal AC voltage: 100 to 240 V at 50/60 Hz

Min/max AC voltage: 88 / 265 V at 25 to 100 Hz

Voltage loss hold-up: 200 ms duration at nominal

ALL RANGES

Volt withstand: 2 × Highest Nominal Voltage for 10 ms

Power consumption: typical = 15 to 20 W/VA
                            maximum = 50 W/VA
                            contact factory for exact order code con-
                            sumption

INTERNAL FUSE

RATINGS
    Low range power supply: 8 A / 250 V
    High range power supply: 4 A / 250 V

INTERRUPTING CAPACITY
    AC: 100 000 A RMS symmetrical
    DC: 10 000 A

2.2.7 OUTPUTS

FORM-A RELAY

Make and carry for 0.2 s: 30 A as per ANSI C37.90

Carry continuous: 6 A

Break (DC inductive, L/R = 40 ms):

VOLTAGE	CURRENT
24 V	1 A
48 V	0.5 A
125 V	0.3 A
250 V	0.2 A

Operate time: < 4 ms

Contact material: silver alloy

LATCHING RELAY

Make and carry for 0.2 s: 30 A as per ANSI C37.90

Carry continuous: 6 A

Break at L/R of 40 ms: 0.25 A DC max.

Operate time: < 4 ms

Contact material: silver alloy

Control: separate operate and reset inputs

Control mode: operate-dominant or reset-dominant

FORM-A VOLTAGE MONITOR

Applicable voltage: approx. 15 to 250 V DC

Trickle current: approx. 1 to 2.5 mA

FORM-A CURRENT MONITOR

Threshold current: approx. 80 to 100 mA

2

FORM-C AND CRITICAL FAILURE RELAY

Make and carry for 0.2 s: 30 A as per ANSI C37.90

Carry continuous: 8 A

Break (DC inductive, L/R = 40 ms):

VOLTAGE	CURRENT
24 V	1 A
48 V	0.5 A
125 V	0.3 A
250 V	0.2 A

Operate time: < 8 ms

Contact material: silver alloy

FAST FORM-C RELAY

Make and carry: 0.1 A max. (resistive load)

Minimum load impedance:

INPUT VOLTAGE	IMPEDANCE	
	2 W RESISTOR	**1 W RESISTOR**
250 V DC	20 KΩ	50 KΩ
120 V DC	5 KΩ	2 KΩ
48 V DC	2 KΩ	2 KΩ
24 V DC	2 KΩ	2 KΩ

Note: values for 24 V and 48 V are the same due to a required 95% voltage drop across the load impedance.

Operate time: < 0.6 ms

Internal Limiting Resistor: 100 Ω, 2 W

SOLID-STATE OUTPUT RELAY

Operate and release time: <100 μs

Maximum voltage: 265 V DC

Maximum continuous current: 5 A at 45°C; 4 A at 65°C

Make and carry:
  for 0.2 s: 30 A as per ANSI C37.90
  for 0.03 s   300 A

Breaking capacity:

	UL508	Utility application (autoreclose scheme)	Industrial application
Operations/ interval	5000 ops / 1 s-On, 9 s-Off	5 ops / 0.2 s-On, 0.2 s-Off within 1 minute	10000 ops / 0.2 s-On, 30 s-Off
	1000 ops / 0.5 s-On, 0.5 s-Off		
Break capability (0 to 250 V DC)	3.2 A L/R = 10 ms	10 A L/R = 40 ms	10 A L/R = 40 ms
	1.6 A L/R = 20 ms		
	0.8 A L/R = 40 ms		

IRIG-B OUTPUT

Amplitude: 10 V peak-peak RS485 level

Maximum load: 100 ohms

Time delay: 1 ms for AM input
                          40 μs for DC-shift input

Isolation: 2 kV

CONTROL POWER EXTERNAL OUTPUT (FOR DRY CONTACT INPUT)

Capacity: 100 mA DC at 48 V DC

Isolation: ±300 Vpk

REMOTE OUTPUTS (IEC 61850 GSSE/GOOSE)

Standard output points: 32

User output points: 32

DIRECT OUTPUTS

Output points: 32

DCMA OUTPUTS

Range: –1 to 1 mA, 0 to 1 mA, 4 to 20 mA

Max. load resistance: 12 kΩ for –1 to 1 mA range
                          12 kΩ for 0 to 1 mA range
                          600 Ω for 4 to 20 mA range

Accuracy: ±0.75% of full-scale for 0 to 1 mA range
                          ±0.5% of full-scale for –1 to 1 mA range
                          ±0.75% of full-scale for 0 to 20 mA range

99% Settling time to a step change: 100 ms

Isolation: 1.5 kV

Driving signal: any FlexAnalog quantity

Upper and lower limit for the driving signal: –90 to 90 pu in steps of 0.001

ETHERNET SWITCH (HIGH VOLTAGE, TYPE 2S)

Nominal DC voltage: 110 to 240 V DC

Minimum DC voltage: 88 V DC

Maximum DC voltage: 300 V DC

Input Current: 0.9 A DC maximum

Nominal AC voltage: 100 to 240 V AC, 0.26 to 0.16 A/26 to 39 VA at 50/60 Hz

Minimum AC voltage: 85 V AC, 0.31 A/22 VA at 50/60 Hz

Maximum AC voltage: 265 V AC, 0.16 A/42 VA at 50/60 Hz

Internal fuse: 3 A / 350 V AC, Ceramic, Axial SLO BLO;
                          Manufacturer: Conquer; Part number: SCD-A 003

ETHERNET SWITCH (LOW VOLTAGE, TYPE 2T)

Nominal voltage: 48 V DC, 0.31 A/15 W

Minimum voltage: 30 V DC, 0.43 A/16 W

Maximum voltage: 60 V DC

Internal fuse: 5 A / 350 V AC, Ceramic, Axial SLO BLO;
                          Manufacturer: Conquer; Part number: SCD-A 005

RS232

Front port: 19.2 kbps, Modbus® RTU

RS485

1 or 2 rear ports: Up to 115 kbps, Modbus® RTU, isolated together at 36 Vpk

Typical distance: 1200 m

Isolation: 2 kV

ETHERNET (FIBER)

PARAMETER	FIBER TYPE		
	10MB MULTI-MODE	**100MB MULTI-MODE**[1]	**100MB SINGLE-MODE**
Wavelength	820 nm	1310 nm	1310 nm
Connector	ST	ST	SC
Transmit power	–20 dBm	–20 dBm	–15 dBm
Receiver sensitivity	–30 dBm	–30 dBm	–30 dBm
Power budget	10 dB	10 dB	15 dB
Maximum input power	–7.6 dBm	–14 dBm	–7 dBm
Typical distance	1.65 km	2 km	15 km
Duplex	full/half	full/half	full/half
Redundancy	yes	yes	yes

1. UR-2S and UR-2T only support 100 Mb multimode

ETHERNET (10/100 MB TWISTED PAIR)

Modes: 10 MB, 10/100 MB (auto-detect)

Connector: RJ45

SNTP clock synchronization error: <10 ms (typical)

ETHERNET SWITCH FIBER OPTIC PORTS

Maximum fiber segment length calculation:

The maximum fiber segment length between two adjacent switches or between a switch and a device is calculated as follows. First, calculate the optical power budget (OPB) of each device using the manufacturer's data sheets.

$$OPB = P_{T(MIN)} - P_{R(MIN)}$$

where OPB = optical power budget, P_T = transmitter output power, and P_R = receiver sensitivity.

The worst case optical power budget (OPB$_{WORST}$) is then calculated by taking the lower of the two calculated power budgets, subtracting 1 dB for LED aging, and then subtracting the total insertion loss. The total insertion loss is calculated by multiplying the number of connectors in each single fiber path by 0.5 dB. For example, with a single fiber cable between the two devices, there will be a minimum of two connections in either transmit or receive fiber paths for a total insertion loss of 1db for either direction:

$$\text{Total insertion loss} = \text{number of connectors} \times 0.5\ dB$$

$$= 2 \times 0.5\ dB = 1.0\ dB$$

The worst-case optical power budget between two type 2T or 2S modules using a single fiber cable is:

$$OPB_{WORST} = OPB - 1\ dB\ (LED\ aging) - \text{total insertion loss}$$

$$10\,dB - 1\,dB - 1\,dB = 8\,dB$$

To calculate the maximum fiber length, divide the worst-case optical power budget by the cable attenuation per unit distance specified in the manufacturer data sheets. For example, typical attenuation for 62.5/125 µm glass fiber optic cable is approximately 2.8 dB per km. In our example, this would result in the following maximum fiber length:

$$\text{Maximum fiber length} = \frac{OPB_{WORST}\ (\text{in dB})}{\text{cable loss (in dB/km)}}$$

$$= \frac{8\ dB}{2.8\ dB/km} = 2.8\,km$$

The customer must use the attenuation specified within the manufacturer data sheets for accurate calculation of the maximum fiber length.

ETHERNET SWITCH 10/100BASE-T PORTS

Connector type: RJ45

MAXIMUM 10 MBPS ETHERNET SEGMENT LENGTHS

Unshielded twisted pair: 100 m (328 ft.)

Shielded twisted pair: 150 m (492 ft.)

MAXIMUM STANDARD FAST ETHERNET SEGMENT LENGTHS

10Base-T (CAT 3, 4, 5 UTP): 100 m (328 ft.)

100Base-TX (CAT 5 UTP):100 m (328 ft.)

Shielded twisted pair: 150 m (492 ft.)

2

SHIELDED TWISTED-PAIR INTERFACE OPTIONS

INTERFACE TYPE	TYPICAL DISTANCE
RS422	1200 m
G.703	100 m

> **NOTE** **RS422 distance is based on transmitter power and does not take into consideration the clock source provided by the user.**

LINK POWER BUDGET

EMITTER, FIBER TYPE	TRANSMIT POWER	RECEIVED SENSITIVITY	POWER BUDGET
820 nm LED, Multimode	–20 dBm	–30 dBm	10 dB
1300 nm LED, Multimode	–21 dBm	–30 dBm	9 dB
1300 nm ELED, Singlemode	–23 dBm	–32 dBm	9 dB
1300 nm Laser, Singlemode	–1 dBm	–30 dBm	29 dB
1550 nm Laser, Singlemode	+5 dBm	–30 dBm	35 dB

> **NOTE** **These power budgets are calculated from the manufacturer's worst-case transmitter power and worst case receiver sensitivity.**

> **NOTE** **The power budgets for the 1300nm ELED are calculated from the manufacturer's transmitter power and receiver sensitivity at ambient temperature. At extreme temperatures these values will deviate based on component tolerance. On average, the output power will decrease as the temperature is increased by a factor 1dB / 5°C.**

MAXIMUM OPTICAL INPUT POWER

EMITTER, FIBER TYPE	MAX. OPTICAL INPUT POWER
820 nm LED, Multimode	–7.6 dBm
1300 nm LED, Multimode	–11 dBm
1300 nm ELED, Singlemode	–14 dBm
1300 nm Laser, Singlemode	–14 dBm
1550 nm Laser, Singlemode	–14 dBm

TYPICAL LINK DISTANCE

EMITTER TYPE	CABLE TYPE	CONNECTOR TYPE	TYPICAL DISTANCE
820 nm LED, multimode	62.5/125 μm	ST	1.65 km
1300 nm LED, multimode	62.5/125 μm	ST	3.8 km
1300 nm ELED, single mode	9/125 μm	ST	11.4 km
1300 nm Laser, single mode	9/125 μm	ST	64 km
1550 nm Laser, single-mode	9/125 μm	ST	105 km

> **NOTE** **Typical distances listed are based on the following assumptions for system loss. As actual losses will vary from one installation to another, the distance covered by your system may vary.**

CONNECTOR LOSSES (TOTAL OF BOTH ENDS)
ST connector   2 dB

FIBER LOSSES
820 nm multimode   3 dB/km
1300 nm multimode   1 dB/km
1300 nm singlemode   0.35 dB/km
1550 nm singlemode   0.25 dB/km
Splice losses: One splice every 2 km, at 0.05 dB loss per splice.

SYSTEM MARGIN
3 dB additional loss added to calculations to compensate for all other losses.

Compensated difference in transmitting and receiving (channel asymmetry) channel delays using GPS satellite clock: 10 ms

AMBIENT TEMPERATURES
Storage: –40 to 80°C

OPERATING TEMPERATURES
Cold: IEC 60068-2-1, 16 h at –40°C
Dry Heat: IEC 60068-2-2, 16 h at +85°C

> **NOTE** The LCD contrast may be impaired at temperatures less than –20°C.

OTHER
Humidity (non-condensing): IEC 60068-2-30, 95%, Variant 1, 6 days
Altitude: Up to 2000 m
Installation Category: II

> **NOTE** **Type test report available upon request.**

THERMAL
Products go through an environmental test based upon an Accepted Quality Level (AQL) sampling process.

APPROVALS
UL Listed for the USA and Canada
CE:

LVD 73/23/EEC:	IEC 1010-1
EMC 81/336/EEC:	EN 50081-2, EN 50082-2

MOUNTING
Attach mounting brackets using 20 inch-pounds (±2 inch-pounds) of torque.

CLEANING
Normally, cleaning is not required; but for situations where dust has accumulated on the faceplate display, a dry cloth can be used.

> **NOTE** Units that are stored in a de-energized state should be powered up once per year, for one hour continuously, to avoid deterioration of electrolytic capacitors.

2

a) HORIZONTAL UNITS

The C60 Breaker Protection System is available as a 19-inch rack horizontal mount unit with a removable faceplate. The faceplate can be specified as either standard or enhanced at the time of ordering. The enhanced faceplate contains additional user-programmable pushbuttons and LED indicators.

The modular design allows the relay to be easily upgraded or repaired by a qualified service person. The faceplate is hinged to allow easy access to the removable modules, and is itself removable to allow mounting on doors with limited rear depth. There is also a removable dust cover that fits over the faceplate, which must be removed when attempting to access the keypad or RS232 communications port.

The case dimensions are shown below, along with panel cutout details for panel mounting. When planning the location of your panel cutout, ensure that provision is made for the faceplate to swing open without interference to or from adjacent equipment.

The relay must be mounted such that the faceplate sits semi-flush with the panel or switchgear door, allowing the operator access to the keypad and the RS232 communications port. The relay is secured to the panel with the use of four screws supplied with the relay.

Figure 3–3: C60 HORIZONTAL MOUNTING AND DIMENSIONS (STANDARD PANEL)

b) VERTICAL UNITS

The C60 Breaker Protection System is available as a reduced size (¾) vertical mount unit, with a removable faceplate. The modular design allows the relay to be easily upgraded or repaired by a qualified service person. The faceplate is hinged to allow easy access to the removable modules, and is itself removable to allow mounting on doors with limited rear depth. There is also a removable dust cover that fits over the faceplate, which must be removed when attempting to access the keypad or RS232 communications port.

The case dimensions are shown below, along with panel cutout details for panel mounting. When planning the location of your panel cutout, ensure that provision is made for the faceplate to swing open without interference to or from adjacent equipment.

The relay must be mounted such that the faceplate sits semi-flush with the panel or switchgear door, allowing the operator access to the keypad and the RS232 communications port. The relay is secured to the panel with the use of four screws supplied with the relay.

3.1.2 MODULE WITHDRAWAL AND INSERTION

⚠️ **WARNING** **Module withdrawal and insertion may only be performed when control power has been removed from the unit. Inserting an incorrect module type into a slot may result in personal injury, damage to the unit or connected equipment, or undesired operation!**

⚠️ **WARNING** **Proper electrostatic discharge protection (for example, a static strap) must be used when coming in contact with modules while the relay is energized!**

The relay, being modular in design, allows for the withdrawal and insertion of modules. Modules must only be replaced with like modules in their original factory configured slots.

The enhanced faceplate can be opened to the left, once the thumb screw has been removed, as shown below. This allows for easy accessibility of the modules for withdrawal. The new wide-angle hinge assembly in the enhanced front panel opens completely and allows easy access to all modules in the C60.

842812A1.CDR

Figure 3–7: UR MODULE WITHDRAWAL AND INSERTION (ENHANCED FACEPLATE)

The standard faceplate can be opened to the left, once the sliding latch on the right side has been pushed up, as shown below. This allows for easy accessibility of the modules for withdrawal.
842760A1.CDR

Figure 3–8: UR MODULE WITHDRAWAL AND INSERTION (STANDARD FACEPLATE)

To properly remove a module, the ejector/inserter clips, located at the top and bottom of each module, must be pulled simultaneously. Before performing this action, **control power must be removed from the relay**. Record the original location of the module to ensure that the same or replacement module is inserted into the correct slot. Modules with current input provide automatic shorting of external CT circuits.

To properly insert a module, ensure that the **correct** module type is inserted into the **correct** slot position. The ejector/inserter clips located at the top and at the bottom of each module must be in the disengaged position as the module is smoothly inserted into the slot. Once the clips have cleared the raised edge of the chassis, engage the clips simultaneously. When the clips have locked into position, the module will be fully inserted.

> **NOTE**
> All CPU modules except the 9E are equipped with 10/100Base-T or 100Base-F Ethernet connectors. These connectors must be individually disconnected from the module before it can be removed from the chassis.

3

> **NOTE**
>
> The 4.0x release of the C60 relay includes new hardware modules.The new CPU modules are specified with codes 9E and higher. The new CT/VT modules are specified with the codes 8F and higher.

The new CT/VT modules can only be used with new CPUs; similarly, old CT/VT modules can only be used with old CPUs. To prevent hardware mismatches, the new modules have blue labels and a warning sticker stating **"Attn.: Ensure CPU and DSP module label colors are the same!"**. In the event that there is a mismatch between the CPU and CT/VT module, the relay will not function and a **DSP ERROR** or **HARDWARE MISMATCH** error will be displayed.

All other input and output modules are compatible with the new hardware. Firmware versions 4.0x and higher are only compatible with the new hardware modules. Previous versions of the firmware (3.4x and earlier) are only compatible with the older hardware modules.

3.1.3 REAR TERMINAL LAYOUT
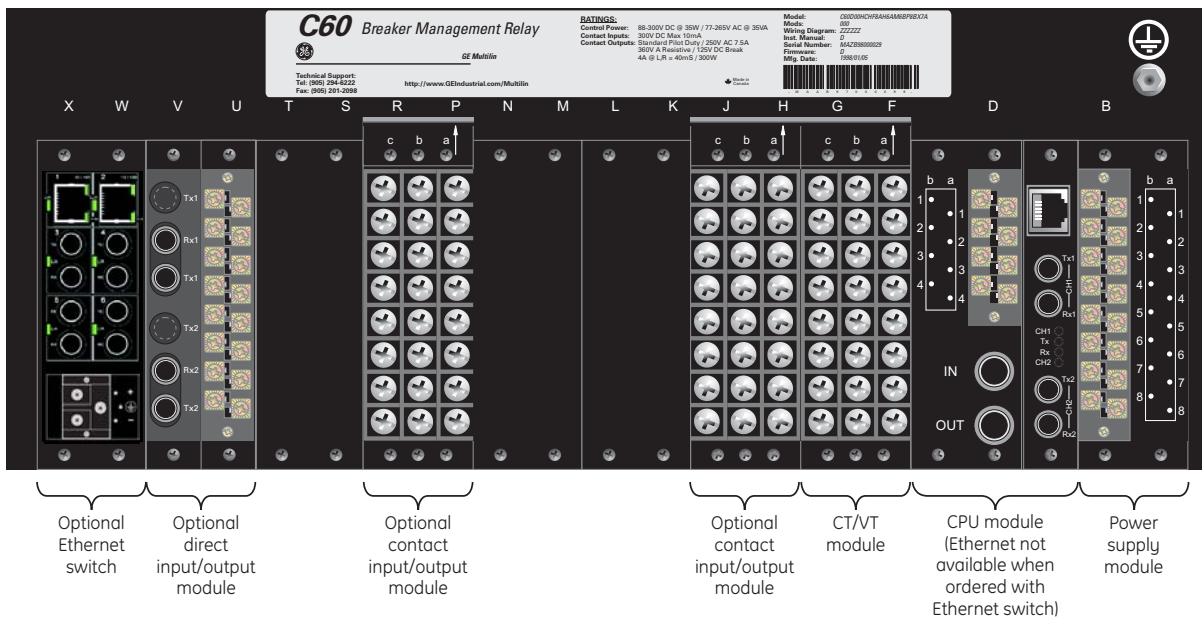

Figure 3–9: REAR TERMINAL VIEW

> **WARNING**
>
> **Do not touch any rear terminals while the relay is energized!**

The relay follows a convention with respect to terminal number assignments which are three characters long assigned in order by module slot position, row number, and column letter. Two-slot wide modules take their slot designation from the first slot position (nearest to CPU module) which is indicated by an arrow marker on the terminal block. See the following figure for an example of rear terminal assignments.
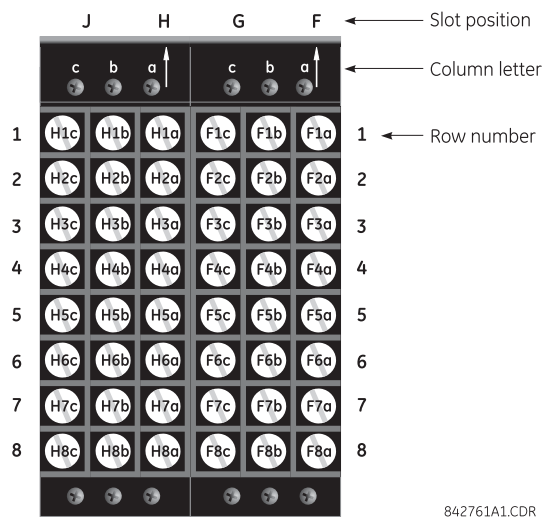

Figure 3–10: EXAMPLE OF MODULES IN F AND H SLOTS

3

This diagram is based on the following order code:
C60-E00-HCL-F8F-H6G-M8F-P6G
This diagram provides an example of how the device
is wired, not specifically how to wire the device.
Please refer to the Instruction Manual for additional details on
wiring based on various configurations.
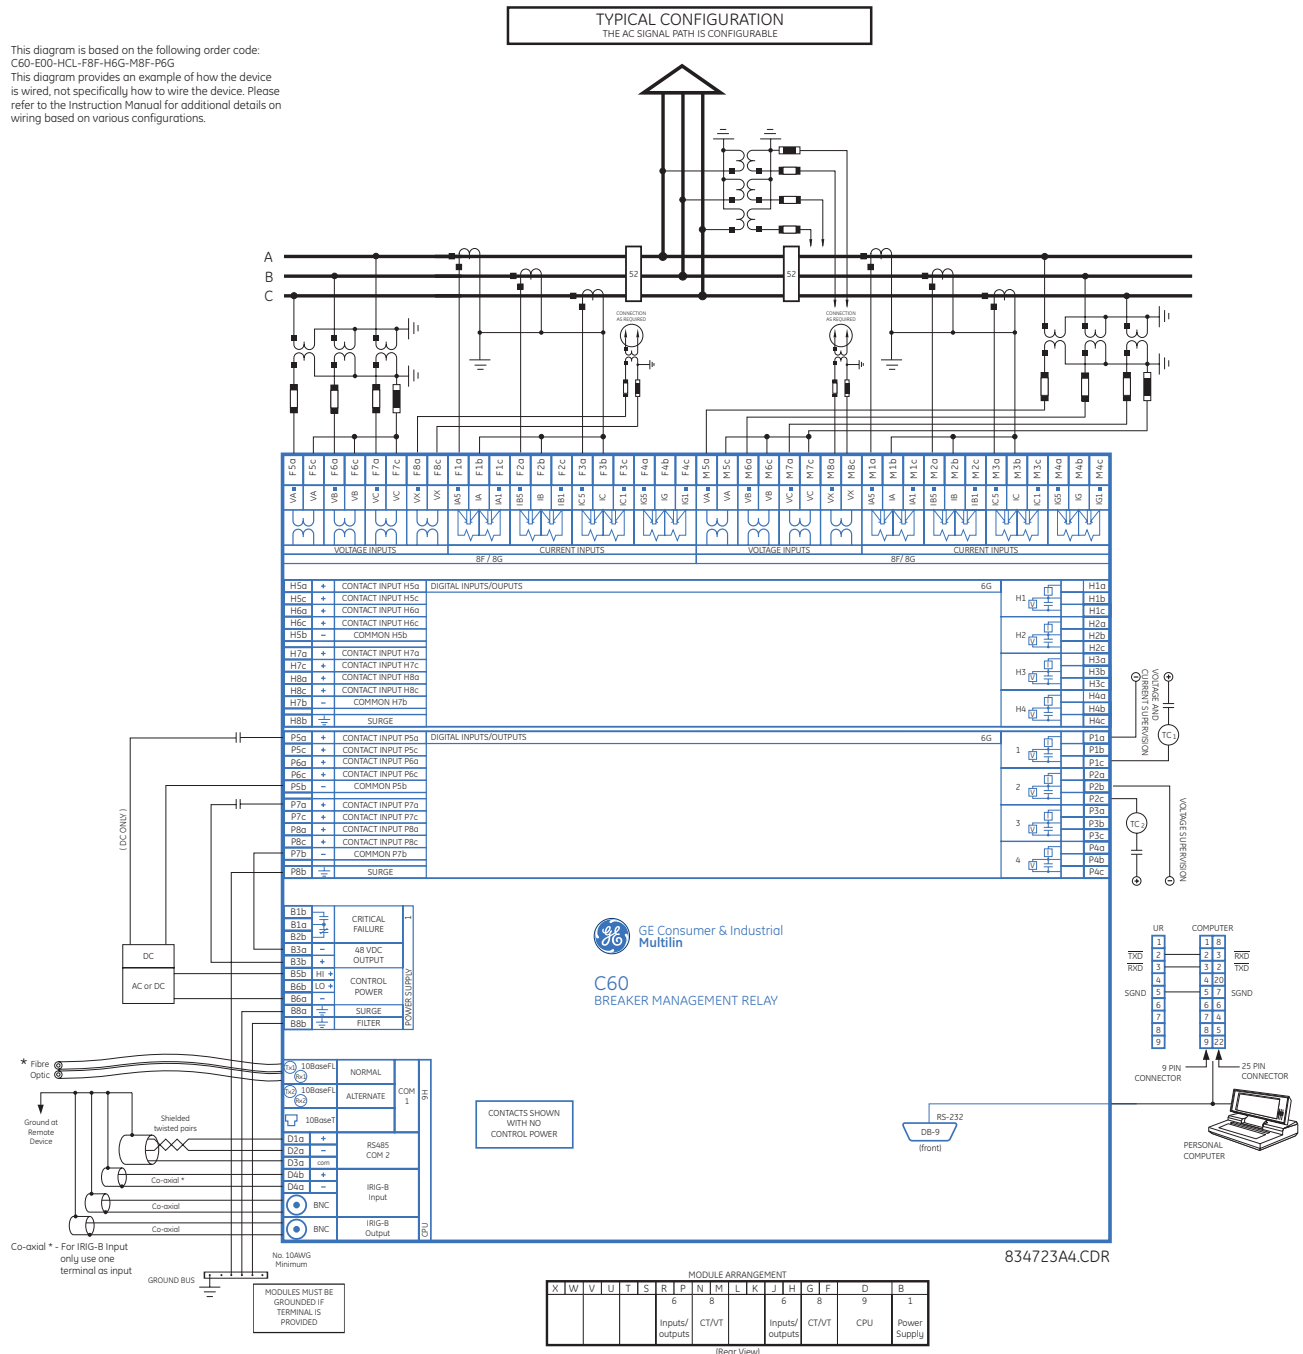

Figure 3–11: TYPICAL WIRING DIAGRAM

The dielectric strength of the UR-series module hardware is shown in the following table:

Table 3–1: DIELECTRIC STRENGTH OF UR-SERIES MODULE HARDWARE

MODULE TYPE	MODULE FUNCTION	TERMINALS		DIELECTRIC STRENGTH (AC)
		FROM	**TO**	
1	Power supply	High (+); Low (+); (–)	Chassis	2000 V AC for 1 minute
1	Power supply	48 V DC (+) and (–)	Chassis	2000 V AC for 1 minute
1	Power supply	Relay terminals	Chassis	2000 V AC for 1 minute
2	Reserved	N/A	N/A	N/A
3	Reserved	N/A	N/A	N/A
4	Reserved	N/A	N/A	N/A
5	Analog inputs/outputs	All except 8b	Chassis	< 50 V DC
6	Digital inputs/outputs	All	Chassis	2000 V AC for 1 minute
7	G.703	All except 2b, 3a, 7b, 8a	Chassis	2000 V AC for 1 minute
7	RS422	All except 6a, 7b, 8a	Chassis	< 50 V DC
8	CT/VT	All	Chassis	2000 V AC for 1 minute
9	CPU	All	Chassis	2000 V AC for 1 minute

Filter networks and transient protection clamps are used in the hardware to prevent damage caused by high peak voltage transients, radio frequency interference (RFI), and electromagnetic interference (EMI). These protective components **can be damaged** by application of the ANSI/IEEE C37.90 specified test voltage for a period longer than the specified one minute.

⚠ CAUTION **CONTROL POWER SUPPLIED TO THE RELAY MUST BE CONNECTED TO THE MATCHING POWER SUPPLY RANGE OF THE RELAY. IF THE VOLTAGE IS APPLIED TO THE WRONG TERMINALS, DAMAGE MAY OCCUR!**

📝 NOTE **The C60 relay, like almost all electronic relays, contains electrolytic capacitors. These capacitors are well known to be subject to deterioration over time if voltage is not applied periodically. Deterioration can be avoided by powering the relays up once a year.**

The power supply module can be ordered for two possible voltage ranges, with or without a redundant power option. Each range has a dedicated input connection for proper operation. The ranges are as shown below (see the *Technical specifications* section of chapter 2 for additional details):

- Low (LO) range: 24 to 48 V (DC only) nominal.
- High (HI) range: 125 to 250 V nominal.

The power supply module provides power to the relay and supplies power for dry contact input connections.

The power supply module provides 48 V DC power for dry contact input connections and a critical failure relay (see the *Typical wiring diagram* earlier). The critical failure relay is a form-C device that will be energized once control power is applied and the relay has successfully booted up with no critical self-test failures. If on-going self-test diagnostic checks detect a critical failure (see the *Self-test errors* section in chapter 7) or control power is lost, the relay will de-energize.

For high reliability systems, the C60 has a redundant option in which two C60 power supplies are placed in parallel on the bus. If one of the power supplies become faulted, the second power supply will assume the full load of the relay without any interruptions. Each power supply has a green LED on the front of the module to indicate it is functional. The critical fail relay of the module will also indicate a faulted power supply.

An LED on the front of the control power module shows the status of the power supply:

LED INDICATION	POWER SUPPLY
CONTINUOUS ON	OK
ON / OFF CYCLING	Failure
OFF	Failure

827759AA.CDR
Figure 3–12: CONTROL POWER CONNECTION

3.2.4 CT/VT MODULES

A CT/VT module may have voltage inputs on channels 1 through 4 inclusive, or channels 5 through 8 inclusive. Channels 1 and 5 are intended for connection to phase A, and are labeled as such in the relay. Likewise, channels 2 and 6 are intended for connection to phase B, and channels 3 and 7 are intended for connection to phase C.

Channels 4 and 8 are intended for connection to a single-phase source. For voltage inputs, these channel are labelled as auxiliary voltage (VX). For current inputs, these channels are intended for connection to a CT between system neutral and ground, and are labelled as ground current (IG).

⚠ **CAUTION**
Verify that the connection made to the relay nominal current of 1 A or 5 A matches the secondary rating of the connected CTs. Unmatched CTs may result in equipment damage or inadequate protection.

CT/VT modules may be ordered with a standard ground current input that is the same as the phase current input. Each AC current input has an isolating transformer and an automatic shorting mechanism that shorts the input when the module is withdrawn from the chassis. There are no internal ground connections on the current inputs. Current transformers with 1 to 50000 A primaries and 1 A or 5 A secondaries may be used.

CT/VT modules with a sensitive ground input are also available. The ground CT input of the sensitive ground modules is ten times more sensitive than the ground CT input of standard CT/VT modules. However, the phase CT inputs and phase VT inputs are the same as those of regular CT/VT modules.

The above modules are available with enhanced diagnostics. These modules can automatically detect CT/VT hardware failure and take the relay out of service.

CT connections for both ABC and ACB phase rotations are identical as shown in the *Typical wiring diagram*.

The exact placement of a zero-sequence core balance CT to detect ground fault current is shown below. Twisted-pair cabling on the zero-sequence CT is recommended.

3
Figure 3–13: ZERO-SEQUENCE CORE BALANCE CT INSTALLATION

The phase voltage channels are used for most metering and protection purposes. The auxiliary voltage channel is used as input for the synchrocheck and volts-per-hertz features.

> **NOTE**
>
> **Substitute the tilde "~" symbol with the slot position of the module in the following figure**.

Figure 3–14: CT/VT MODULE WIRING

Every digital input/output module has 24 terminal connections. They are arranged as three terminals per row, with eight rows in total. A given row of three terminals may be used for the outputs of one relay. For example, for form-C relay outputs, the terminals connect to the normally open (NO), normally closed (NC), and common contacts of the relay. For a form-A output, there are options of using current or voltage detection for feature supervision, depending on the module ordered. The terminal configuration for contact inputs is different for the two applications.

The digital inputs are grouped with a common return. The C60 has two versions of grouping: four inputs per common return and two inputs per common return. When a digital input/output module is ordered, four inputs per common is used. The four inputs per common allows for high-density inputs in combination with outputs, with a compromise of four inputs sharing one common. If the inputs must be isolated per row, then two inputs per common return should be selected (4D module).

The tables and diagrams on the following pages illustrate the module types (6A, etc.) and contact arrangements that may be ordered for the relay. Since an entire row is used for a single contact output, the name is assigned using the module slot position and row number. However, since there are two contact inputs per row, these names are assigned by module slot position, row number, and column position.

Some form-A / solid-state relay outputs include circuits to monitor the DC voltage across the output contact when it is open, and the DC current through the output contact when it is closed. Each of the monitors contains a level detector whose output is set to logic "On = 1" when the current in the circuit is above the threshold setting. The voltage monitor is set to "On = 1" when the current is above about 1 to 2.5 mA, and the current monitor is set to "On = 1" when the current exceeds about 80 to 100 mA. The voltage monitor is intended to check the health of the overall trip circuit, and the current monitor can be used to seal-in the output contact until an external contact has interrupted current flow.

Block diagrams are shown below for form-A and form-A / solid-state relay outputs with optional voltage monitor, optional current monitor, and with no monitoring

Figure 3–16: FORM-A AND SOLID STATE CONTACT FUNCTIONS

The operation of voltage and current monitors is reflected with the corresponding FlexLogic™ operands (CONT OP # VON, CONT OP # VOFF, CONT OP # ION, and CONT OP # IOFF) which can be used in protection, control and alarm logic. The typical application of the voltage monitor is breaker trip circuit integrity monitoring; a typical application of the current monitor is seal-in of the control command.

Refer to the *Digital elements* section of chapter 5 for an example of how form-A and solid-state relay contacts can be applied for breaker trip circuit integrity monitoring.

> ⚠️ **WARNING**
> **Relay contacts must be considered unsafe to touch when the unit is energized! If the relay contacts need to be used for low voltage accessible applications, it is the customer's responsibility to ensure proper insulation levels!**

> **NOTE**
> **USE OF FORM-A AND SOLID-STATE RELAY OUTPUTS IN HIGH IMPEDANCE CIRCUITS**
>
> For form-A and solid-state relay output contacts internally equipped with a voltage measuring cIrcuit across the contact, the circuit has an impedance that can cause a problem when used in conjunction with external high input impedance monitoring equipment such as modern relay test set trigger circuits. These monitoring circuits may continue to read the form-A contact as being closed after it has closed and subsequently opened, when measured as an impedance.
>
> The solution to this problem is to use the voltage measuring trigger input of the relay test set, and connect the form-A contact through a voltage-dropping resistor to a DC voltage source. If the 48 V DC output of the power supply is used as a source, a 500 Ω, 10 W resistor is appropriate. In this configuration, the voltage across either the form-A contact or the resistor can be used to monitor the state of the output.

> **NOTE**
> **Wherever a tilde "~" symbol appears, substitute with the slot position of the module; wherever a number sign "#" appears, substitute the contact number**

> **NOTE**
> **When current monitoring is used to seal-in the form-A and solid-state relay contact outputs, the FlexLogic™ operand driving the contact output should be given a reset delay of 10 ms to prevent damage of the output contact (in situations when the element initiating the contact output is bouncing, at values in the region of the pickup value).**

3
842763A1.CDR

Figure 3–18: DIGITAL INPUT/OUTPUT MODULE WIRING (2 of 2)

⚠ **CAUTION**

CORRECT POLARITY MUST BE OBSERVED FOR ALL CONTACT INPUT AND SOLID STATE OUTPUT CON-NECTIONS FOR PROPER FUNCTIONALITY.

CONTACT INPUTS:

A dry contact has one side connected to terminal B3b. This is the positive 48 V DC voltage rail supplied by the power supply module. The other side of the dry contact is connected to the required contact input terminal. Each contact input group has its own common (negative) terminal which must be connected to the DC negative terminal (B3a) of the power supply module. When a dry contact closes, a current of 1 to 3 mA will flow through the associated circuit.

A wet contact has one side connected to the positive terminal of an external DC power supply. The other side of this contact is connected to the required contact input terminal. If a wet contact is used, then the negative side of the external source must be connected to the relay common (negative) terminal of each contact group. The maximum external source voltage for this arrangement is 300 V DC.

The voltage threshold at which each group of four contact inputs will detect a closed contact input is programmable as 17 V DC for 24 V sources, 33 V DC for 48 V sources, 84 V DC for 110 to 125 V sources, and 166 V DC for 250 V sources.
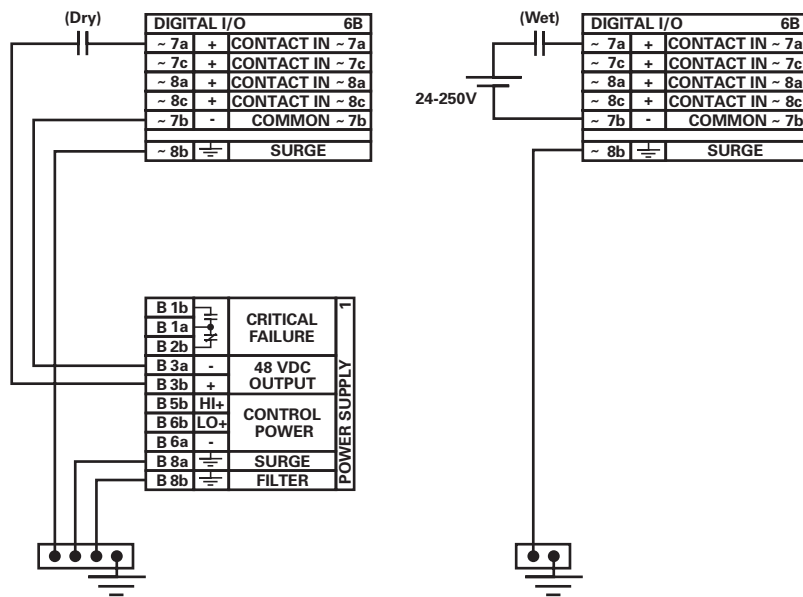

Figure 3–19: DRY AND WET CONTACT INPUT CONNECTIONS

> **NOTE**
>
> **Wherever a tilde "~" symbol appears, substitute with the slot position of the module.**

Contact outputs may be ordered as form-a or form-C. The form-A contacts may be connected for external circuit supervision. These contacts are provided with voltage and current monitoring circuits used to detect the loss of DC voltage in the circuit, and the presence of DC current flowing through the contacts when the form-A contact closes. If enabled, the current monitoring can be used as a seal-in signal to ensure that the form-A contact does not attempt to break the energized inductive coil circuit and weld the output contacts.

> **NOTE**
>
> **There is no provision in the relay to detect a DC ground fault on 48 V DC control power external output. We recommend using an external DC supply.**

USE OF CONTACT INPUTS WITH AUTO-BURNISHING:

The contact inputs sense a change of the state of the external device contact based on the measured current. When external devices are located in a harsh industrial environment (either outdoor or indoor), their contacts can be exposed to various types of contamination. Normally, there is a thin film of insulating sulfidation, oxidation, or contaminates on the surface of the contacts, sometimes making it difficult or impossible to detect a change of the state. This film must be removed to establish circuit continuity – an impulse of higher than normal current can accomplish this.

The contact inputs with auto-burnish create a high current impulse when the threshold is reached to burn off this oxidation layer as a maintenance to the contacts. Afterwards the contact input current is reduced to a steady-state current. The impulse will have a 5 second delay after a contact input changes state.
Figure 3–20: CURRENT THROUGH CONTACT INPUTS WITH AUTO-BURNISHING

Regular contact inputs limit current to less than 3 mA to reduce station battery burden. In contrast, contact inputs with auto-burnishing allow currents up to 50 to 70 mA at the first instance when the change of state was sensed. Then, within 25 to 50 ms, this current is slowly reduced to 3 mA as indicated above. The 50 to 70 mA peak current burns any film on the contacts, allowing for proper sensing of state changes. If the external device contact is bouncing, the auto-burnishing starts when external device contact bouncing is over.

Another important difference between the auto-burnishing input module and the regular input modules is that only two contact inputs have common ground, as opposed to four contact inputs sharing one common ground (refer to the *Digital Input/Output Module Wiring* diagrams). This is beneficial when connecting contact inputs to separate voltage sources. Consequently, the threshold voltage setting is also defined per group of two contact inputs.

The auto-burnish feature can be disabled or enabled using the DIP switches found on each daughter card. There is a DIP switch for each contact, for a total of 16 inputs.

CONTACT INPUT 1 AUTO-BURNISH = OFF
CONTACT INPUT 2 AUTO-BURNISH = OFF

CONTACT INPUT 1 AUTO-BURNISH = ON

CONTACT INPUT 1 AUTO-BURNISH = ON
CONTACT INPUT 2 AUTO-BURNISH = ON
Figure 3–21: AUTO-BURNISH DIP SWITCHES

NOTE
The auto-burnish circuitry has an internal fuse for safety purposes. During regular maintenance, the auto-burnish functionality can be checked using an oscilloscope.

Transducer input modules can receive input signals from external dcmA output transducers (dcmA In) or resistance temperature detectors (RTD). Hardware and software is provided to receive signals from these external transducers and convert these signals into a digital format for use as required.

Transducer output modules provide DC current outputs in several standard dcmA ranges. Software is provided to configure virtually any analog quantity used in the relay to drive the analog outputs.

Every transducer input/output module has a total of 24 terminal connections. These connections are arranged as three terminals per row with a total of eight rows. A given row may be used for either inputs or outputs, with terminals in column "a" having positive polarity and terminals in column "c" having negative polarity. Since an entire row is used for a single input/output channel, the name of the channel is assigned using the module slot position and row number.

Each module also requires that a connection from an external ground bus be made to terminal 8b. The current outputs require a twisted-pair shielded cable, where the shield is grounded at one end only. The figure below illustrates the transducer module types (5A, 5C, 5D, 5E, and 5F) and channel arrangements that may be ordered for the relay.

> **NOTE**
> Wherever a tilde "~" symbol appears, substitute with the slot position of the module.

Figure 3–22: TRANSDUCER INPUT/OUTPUT MODULE WIRING

3.2.7 RS232 FACEPLATE PORT

A 9-pin RS232C serial port is located on the C60 faceplate for programming with a personal computer. All that is required to use this interface is a personal computer running the EnerVista UR Setup software provided with the relay. Cabling for the RS232 port is shown in the following figure for both 9-pin and 25-pin connectors.

> **NOTE**
> The baud rate for this port is fixed at **19200 bps**.

Figure 3–23: RS232 FACEPLATE PORT CONNECTION

3.2.8 CPU COMMUNICATION PORTS

a) OPTIONS

In addition to the faceplate RS232 port, the C60 provides two additional communication ports or a managed six-port Ethernet switch, depending on the installed CPU module.

> **NOTE**
> The CPU modules do not require a surge ground connection.

Table 3–3: CPU MODULE COMMUNICATIONS

CPU TYPE	COM1	COM2
9E	RS485	RS485
9G	10Base-F and 10Base-T	RS485
9H	Redundant 10Base-F	RS485
9J	100Base-FX	RS485

b) RS485 PORTS

RS485 data transmission and reception are accomplished over a single twisted pair with transmit and receive data alternating over the same two wires. Through the use of these ports, continuous monitoring and control from a remote computer, SCADA system or PLC is possible.

To minimize errors from noise, the use of shielded twisted pair wire is recommended. Correct polarity must also be observed. For instance, the relays must be connected with all RS485 "+" terminals connected together, and all RS485 "–" terminals connected together. The COM terminal should be connected to the common wire inside the shield, when provided. To avoid loop currents, the shield should be grounded at one point only. Each relay should also be daisy chained to the next one in the link. A maximum of 32 relays can be connected in this manner without exceeding driver capability. For larger systems, additional serial channels must be added. It is also possible to use commercially available repeaters to increase the number of relays on a single channel to more than 32. Star or stub connections should be avoided entirely.

Lightning strikes and ground surge currents can cause large momentary voltage differences between remote ends of the communication link. For this reason, surge protection devices are internally provided at both communication ports. An isolated power supply with an optocoupled data interface also acts to reduce noise coupling. To ensure maximum reliability, all equipment should have similar transient protection devices installed.

Both ends of the RS485 circuit should also be terminated with an impedance as shown below.

Figure 3–25: RS485 SERIAL CONNECTION

c) 10BASE-FL AND 100BASE-FX FIBER OPTIC PORTS

CAUTION

ENSURE THE DUST COVERS ARE INSTALLED WHEN THE FIBER IS NOT IN USE. DIRTY OR SCRATCHED CONNECTORS CAN LEAD TO HIGH LOSSES ON A FIBER LINK.

CAUTION

OBSERVING ANY FIBER TRANSMITTER OUTPUT MAY CAUSE INJURY TO THE EYE.

The fiber optic communication ports allow for fast and efficient communications between relays at 10 Mbps or 100 Mbps. Optical fiber may be connected to the relay supporting a wavelength of 820 nm in multi-mode or 1310 nm in multi-mode and single-mode. The 10 Mbps rate is available for CPU modules 9G and 9H; 100Mbps is available for modules 9H, 9J, 9K, 9L, 9M, 9N, 9P, and 9R. The 9H, 9K, 9M, and 9R modules have a second pair of identical optical fiber transmitter and receiver for redundancy.

The optical fiber sizes supported include 50/125 µm, 62.5/125 µm and 100/140 µm for 10 Mbps. The fiber optic port is designed such that the response times will not vary for any core that is 100 µm or less in diameter, 62.5 µm for 100 Mbps. For optical power budgeting, splices are required every 1 km for the transmitter/receiver pair. When splicing optical fibers, the diameter and numerical aperture of each fiber must be the same. In order to engage or disengage the ST type connector, only a quarter turn of the coupling is required.

3

IRIG-B is a standard time code format that allows stamping of events to be synchronized among connected devices within 1 millisecond. The IRIG time code formats are serial, width-modulated codes which can be either DC level shifted or amplitude modulated (AM). Third party equipment is available for generating the IRIG-B signal; this equipment may use a GPS satellite system to obtain the time reference so that devices at different geographic locations can also be synchronized.

Figure 3–26: IRIG-B CONNECTION

The IRIG-B repeater provides an amplified DC-shift IRIG-B signal to other equipment. By using one IRIG-B serial connection, several UR-series relays can be synchronized. The IRIG-B repeater has a bypass function to maintain the time signal even when a relay in the series is powered down.
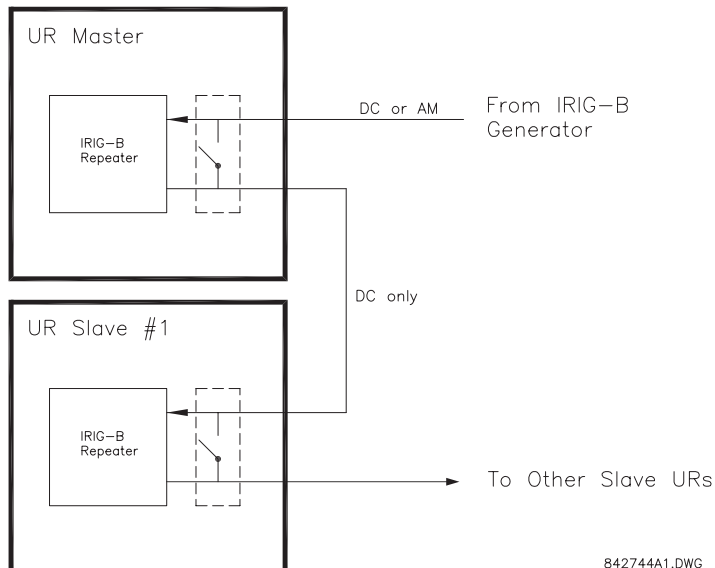

Figure 3–27: IRIG-B REPEATER

Using an amplitude modulated receiver will cause errors up to 1 ms in event time-stamping.

The C60 direct inputs and outputs feature makes use of the type 7 series of communications modules. These modules are also used by the L90 Line Differential Relay for inter-relay communications. The direct input and output feature uses the communications channels provided by these modules to exchange digital state information between relays. This feature is available on all UR-series relay models except for the L90 Line Differential relay.

The communications channels are normally connected in a ring configuration as shown below. The transmitter of one module is connected to the receiver of the next module. The transmitter of this second module is then connected to the receiver of the next module in the ring. This is continued to form a communications ring. The figure below illustrates a ring of four UR-series relays with the following connections: UR1-Tx to UR2-Rx, UR2-Tx to UR3-Rx, UR3-Tx to UR4-Rx, and UR4-Tx to UR1-Rx. A maximum of sixteen (16) UR-series relays can be connected in a single ring

Figure 3–28: DIRECT INPUT AND OUTPUT SINGLE CHANNEL CONNECTION

The interconnection for dual-channel Type 7 communications modules is shown below. Two channel modules allow for a redundant ring configuration. That is, two rings can be created to provide an additional independent data path. The required connections are: UR1-Tx1 to UR2-Rx1, UR2-Tx1 to UR3-Rx1, UR3-Tx1 to UR4-Rx1, and UR4-Tx1 to UR1-Rx1 for the first ring; and UR1-Tx2 to UR4-Rx2, UR4-Tx2 to UR3-Rx2, UR3-Tx2 to UR2-Rx2, and UR2-Tx2 to UR1-Rx2 for the second ring.

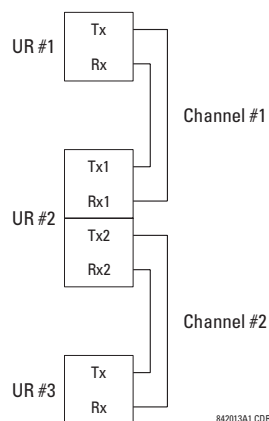

Figure 3–29: DIRECT INPUT AND OUTPUT DUAL CHANNEL CONNECTION

The following diagram shows the connection for three UR-series relays using two independent communication channels. UR1 and UR3 have single type 7 communication modules; UR2 has a dual-channel module. The two communication channels can be of different types, depending on the Type 7 modules used. To allow the direct input and output data to *crossover* from channel 1 to channel 2 on UR2, the **DIRECT I/O CHANNEL CROSSOVER** setting should be "Enabled" on UR2. This forces UR2 to forward messages received on Rx1 out Tx2, and messages received on Rx2 out Tx1.

Figure 3–30: DIRECT INPUT AND OUTPUT SINGLE/DUAL CHANNEL COMBINATION CONNECTION

The interconnection requirements are described in further detail in this section for each specific variation of type 7 communications module. These modules are listed in the following table. All fiber modules use ST type connectors.

NOTE Not all the direct input and output communications modules may be applicable to the C60 relay. Only the modules specified in the order codes are available as direct input and output communications modules.

⚠ **CAUTION**

OBSERVING ANY FIBER TRANSMITTER OUTPUT MAY CAUSE INJURY TO THE EYE.

3.3.2 FIBER: LED AND ELED TRANSMITTERS

The following figure shows the configuration for the 7A, 7B, 7C, 7H, 7I, and 7J fiber-only modules.

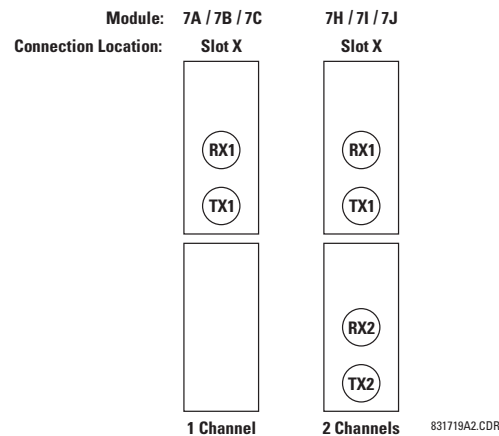

Figure 3–31: LED AND ELED FIBER MODULES

3.3.3 FIBER-LASER TRANSMITTERS

The following figure shows the configuration for the 72, 73, 7D, and 7K fiber-laser module.

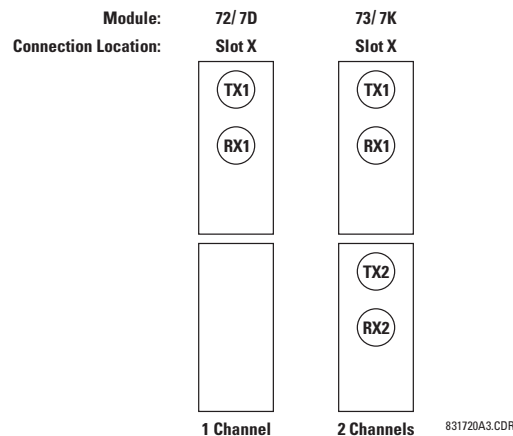

Figure 3–32: LASER FIBER MODULES

⚠ **WARNING**

When using a laser Interface, attenuators may be necessary to ensure that you do *not* exceed the maximum optical input power to the receiver.

a) DESCRIPTION

The following figure shows the 64K ITU G.703 co-directional interface configuration.

> **NOTE**
> **The G.703 module is fixed at 64 kbps. The** SETTINGS ⇨ PRODUCT SETUP ⇨⇩ DIRECT I/O ⇨⇩ DIRECT I/O DATA RATE
> **setting is not applicable to this module.**

AWG 24 twisted shielded pair is recommended for external connections, with the shield grounded only at one end. Connecting the shield to pin X1a or X6a grounds the shield since these pins are internally connected to ground. Thus, if pin X1a or X6a is used, do not ground at the other end. This interface module is protected by surge suppression devices.

Figure 3–33: G.703 INTERFACE CONFIGURATION

The following figure shows the typical pin interconnection between two G.703 interfaces. For the actual physical arrangement of these pins, see the *Rear terminal assignments* section earlier in this chapter. All pin interconnections are to be maintained for a connection to a multiplexer.

Figure 3–34: TYPICAL PIN INTERCONNECTION BETWEEN TWO G.703 INTERFACES

> **NOTE**
> **Pin nomenclature may differ from one manufacturer to another. Therefore, it is not uncommon to see pin-outs numbered TxA, TxB, RxA and RxB. In such cases, it can be assumed that "A" is equivalent to "+" and "B" is equivalent to "–".**

b) G.703 SELECTION SWITCH PROCEDURES

1. Remove the G.703 module (7R or 7S). The ejector/inserter clips located at the top and at the bottom of each module, must be pulled simultaneously in order to release the module for removal. Before performing this action, **control power must be removed from the relay**. The original location of the module should be recorded to help ensure that the same or replacement module is inserted into the correct slot.

2. Remove the module cover screw.

3. Remove the top cover by sliding it towards the rear and then lift it upwards.

4. Set the timing selection switches (channel 1, channel 2) to the desired timing modes.

5. Replace the top cover and the cover screw.

6. Re-insert the G.703 module. Take care to ensure that the **correct** module type is inserted into the **correct** slot position. The ejector/inserter clips located at the top and at the bottom of each module must be in the disengaged position as the module is smoothly inserted into the slot. Once the clips have cleared the raised edge of the chassis, engage the clips simultaneously. When the clips have locked into position, the module will be fully inserted.

Figure 3–35: G.703 TIMING SELECTION SWITCH SETTING

Table 3–5: G.703 TIMING SELECTIONS

| SWITCHES	FUNCTION
S1	OFF → octet timing disabled ON → octet timing 8 kHz
S5 and S6	S5 = OFF and S6 = OFF → loop timing mode S5 = ON and S6 = OFF → internal timing mode S5 = OFF and S6 = ON → minimum remote loopback mode S5 = ON and S6 = ON → dual loopback mode

c) G.703 OCTET TIMING

If octet timing is enabled (on), this 8 kHz signal will be asserted during the violation of bit 8 (LSB) necessary for connecting to higher order systems. When C60s are connected back to back, octet timing should be disabled (off).

d) G.703 TIMING MODES

There are two timing modes for the G.703 module: internal timing mode and loop timing mode (default).

• **Internal Timing Mode:** The system clock is generated internally. Therefore, the G.703 timing selection should be in the internal timing mode for back-to-back (UR-to-UR) connections. For back-to-back connections, set for octet timing (S1 = OFF) and timing mode to internal timing (S5 = ON and S6 = OFF).

• **Loop Timing Mode:** The system clock is derived from the received line signal. Therefore, the G.703 timing selection should be in loop timing mode for connections to higher order systems. For connection to a higher order system (UR-to-multiplexer, factory defaults), set to octet timing (S1 = ON) and set timing mode to loop timing (S5 = OFF and S6 = OFF).

The switch settings for the internal and loop timing modes are shown below:
e) G.703 TEST MODES

In *minimum remote loopback* mode, the multiplexer is enabled to return the data from the external interface without any processing to assist in diagnosing G.703 line-side problems irrespective of clock rate. Data enters from the G.703 inputs, passes through the data stabilization latch which also restores the proper signal polarity, passes through the multiplexer and then returns to the transmitter. The differential received data is processed and passed to the G.703 transmitter module after which point the data is discarded. The G.703 receiver module is fully functional and continues to process data and passes it to the differential Manchester transmitter module. Since timing is returned as it is received, the timing source is expected to be from the G.703 line side of the interface.

DMR = Differential Manchester Receiver
DMX = Differential Manchester Transmitter
G7X = G703 Transmitter
G7R = G703 Receiver

Figure 3–36: G.703 MINIMUM REMOTE LOOPBACK MODE

In *dual loopback mode*, the multiplexers are active and the functions of the circuit are divided into two with each receiver/transmitter pair linked together to deconstruct and then reconstruct their respective signals. Differential Manchester data enters the Differential Manchester receiver module and then is returned to the differential Manchester transmitter module. Likewise, G.703 data enters the G.703 receiver module and is passed through to the G.703 transmitter module to be returned as G.703 data. Because of the complete split in the communications path and because, in each case, the clocks are extracted and reconstructed with the outgoing data, in this mode there must be two independent sources of timing. One source lies on the G.703 line side of the interface while the other lies on the differential Manchester side of the interface.

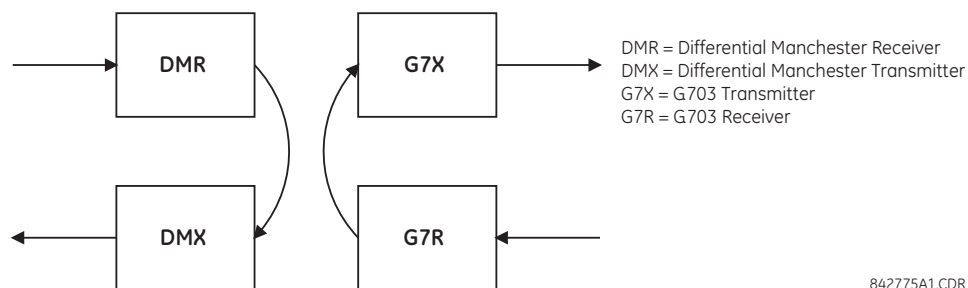

DMR = Differential Manchester Receiver
DMX = Differential Manchester Transmitter
G7X = G703 Transmitter
G7R = G703 Receiver

Figure 3–37: G.703 DUAL LOOPBACK MODE

a) DESCRIPTION

There are two RS422 inter-relay communications modules available: single-channel RS422 (module 7T) and dual-channel RS422 (module 7W). The modules can be configured to run at 64 kbps or 128 kbps. AWG 24 twisted shielded pair cable is recommended for external connections. These modules are protected by optically-isolated surge suppression devices.

The shield pins (6a and 7b) are internally connected to the ground pin (8a). Proper shield termination is as follows:

- Site 1: Terminate shield to pins 6a or 7b or both.
- Site 2: Terminate shield to COM pin 2b.

The clock terminating impedance should match the impedance of the line.

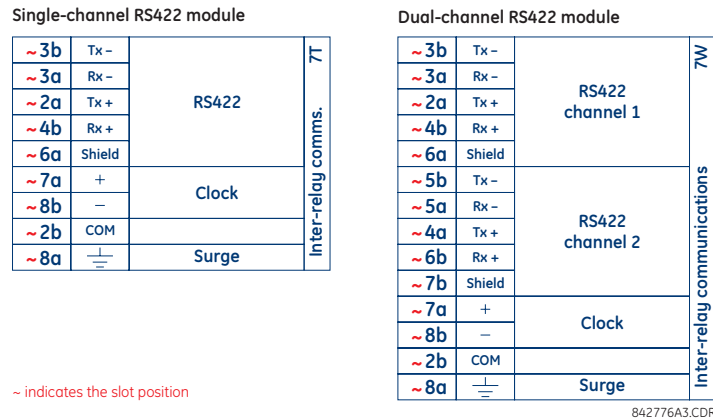

Figure 3–38: RS422 INTERFACE CONNECTIONS

The following figure shows the typical pin interconnection between two single-channel RS422 interfaces installed in slot W. All pin interconnections are to be maintained for a connection to a multiplexer.

Figure 3–39: TYPICAL PIN INTERCONNECTION BETWEEN TWO RS422 INTERFACES

b) TWO-CHANNEL APPLICATION VIA MULTIPLEXERS

The RS422 interface may be used for single channel or two channel applications over SONET/SDH or multiplexed systems. When used in single-channel applications, the RS422 interface links to higher order systems in a typical fashion observing transmit (Tx), receive (Rx), and send timing (ST) connections. However, when used in two-channel applications, certain criteria must be followed since there is one clock input for the two RS422 channels. The system will function correctly if the following connections are observed and your data module has a terminal timing feature. Terminal timing is a common feature to most synchronous data units that allows the module to accept timing from an external source. Using the terminal timing feature, two channel applications can be achieved if these connections are followed: The send timing outputs from the multiplexer (data module 1), will connect to the clock inputs of the UR–RS422 interface in the usual fashion. In addition, the send timing outputs of data module 1 will also be paralleled to the terminal timing inputs of data module 2. By using this configuration, the timing for both data modules and both UR–RS422 channels will be derived from a single clock source. As a result, data sampling for both of the UR–RS422 channels will be synchronized via the send timing leads on data module 1 as shown below. If the terminal timing feature is not available or this type of connection is not desired, the G.703 interface is a viable option that does not impose timing restrictions.
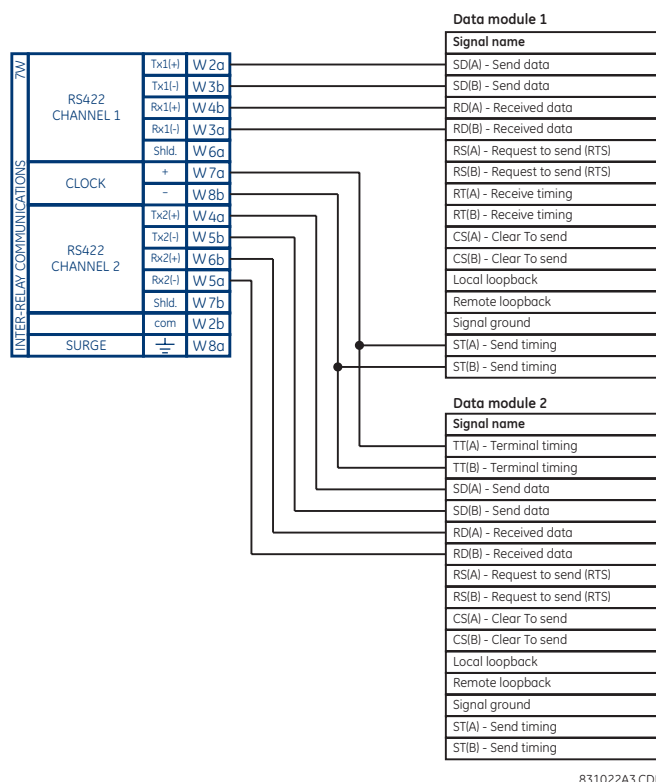

Figure 3–40: TIMING CONFIGURATION FOR RS422 TWO-CHANNEL, 3-TERMINAL APPLICATION

Data module 1 provides timing to the C60 RS422 interface via the ST(A) and ST(B) outputs. Data module 1 also provides timing to data module 2 TT(A) and TT(B) inputs via the ST(A) and AT(B) outputs. The data module pin numbers have been omitted in the figure above since they may vary depending on the manufacturer.

c) TRANSMIT TIMING

The RS422 interface accepts one clock input for transmit timing. It is important that the rising edge of the 64 kHz transmit timing clock of the multiplexer interface is sampling the data in the center of the transmit data window. Therefore, it is important to confirm clock and data transitions to ensure proper system operation. For example, the following figure shows the positive edge of the Tx clock in the center of the Tx data bit.
Figure 3–41: CLOCK AND DATA TRANSITIONS

d) RECEIVE TIMING

The RS422 interface utilizes NRZI-MARK modulation code and; therefore, does not rely on an Rx clock to recapture data. NRZI-MARK is an edge-type, invertible, self-clocking code.

To recover the Rx clock from the data-stream, an integrated DPLL (digital phase lock loop) circuit is utilized. The DPLL is driven by an internal clock, which is 16-times over-sampled, and uses this clock along with the data-stream to generate a data clock that can be used as the SCC (serial communication controller) receive clock.

3.3.6 RS422 AND FIBER INTERFACE

The following figure shows the combined RS422 plus Fiber interface configuration at 64K baud. The 7L, 7M, 7N, 7P, and 74 modules are used in two-terminal with a redundant channel or three-terminal configurations where channel 1 is employed via the RS422 interface (possibly with a multiplexer) and channel 2 via direct fiber.

AWG 24 twisted shielded pair is recommended for external RS422 connections and the shield should be grounded only at one end. For the direct fiber channel, power budget issues should be addressed properly.

WARNING
When using a LASER Interface, attenuators may be necessary to ensure that you do not exceed maximum optical input power to the receiver.

~1a	+	Clock (channel 1)	7L, 7M, 7N, 7P, 74
~1b	−		
~2b	COM		
~2a	Tx1 +	RS422 channel 1	Inter-relay comms.

Figure 3–42: RS422 AND FIBER INTERFACE CONNECTION

Connections shown above are for multiplexers configured as DCE (data communications equipment) units.

3.3.7 G.703 AND FIBER INTERFACE

The figure below shows the combined G.703 plus fiber interface configuration at 64 kbps. The 7E, 7F, 7G, 7Q, and 75 modules are used in configurations where channel 1 is employed via the G.703 interface (possibly with a multiplexer) and channel 2 via direct fiber. AWG 24 twisted shielded pair is recommended for external G.703 connections connecting the shield to pin 1a at one end only. For the direct fiber channel, power budget issues should be addressed properly. See previous sections for additional details on the G.703 and fiber interfaces.

WARNING
When using a laser Interface, attenuators may be necessary to ensure that you do *not* exceed the maximum optical input power to the receiver.

~1a	Shield	G.703 channel 1	7E, 7F, 7G, 7Q, 75

~3a	Rx +		
~3b	⏚	Surge	
(Tx2) (Rx2)		Fiber channel 2	

842778A1.CDR

Figure 3–43: G.703 AND FIBER INTERFACE CONNECTION

The UR-series IEEE C37.94 communication modules (modules types 2G, 2H, 76, and 77) are designed to interface with IEEE C37.94 compliant digital multiplexers or an IEEE C37.94 compliant interface converter for use with direct input and output applications for firmware revisions 3.30 and higher. The IEEE C37.94 standard defines a point-to-point optical link for synchronous data between a multiplexer and a teleprotection device. This data is typically 64 kbps, but the standard provides for speeds up to 64n kbps, where n = 1, 2,…, 12. The UR-series C37.94 communication modules are either 64 kbps (with n fixed at 1) for 128 kbps (with n fixed at 2). The frame is a valid International Telecommunications Union (ITU-T) recommended G.704 pattern from the standpoint of framing and data rate. The frame is 256 bits and is repeated at a frame rate of 8000 Hz, with a resultant bit rate of 2048 kbps.

The specifications for the module are as follows:.

- IEEE standard: C37.94 for 1 $\times$ 64 kbps optical fiber interface (for 2G and 2H modules) or C37.94 for 2 $\times$ 64 kbps optical fiber interface (for 76 and 77 modules).

- Fiber optic cable type: 50 mm or 62.5 mm core diameter optical fiber.

- Fiber optic mode: multi-mode.

- Fiber optic cable length: up to 2 km.

- Fiber optic connector: type ST.

- Wavelength: 830 ±40 nm.

- Connection: as per all fiber optic connections, a Tx to Rx connection is required.

The UR-series C37.94 communication module can be connected directly to any compliant digital multiplexer that supports the IEEE C37.94 standard as shown below.
842755A1.CDR

The UR-series C37.94 communication module can be connected to the electrical interface (G.703, RS422, or X.21) of a non-compliant digital multiplexer via an optical-to-electrical interface converter that supports the IEEE C37.94 standard, as shown below.
842756A1.CDR

The UR-series C37.94 communication module has six (6) switches that are used to set the clock configuration. The functions of these control switches is shown below.

842753A1.CDR

For the internal timing mode, the system clock is generated internally. therefore, the timing switch selection should be internal timing for relay 1 and loop timed for relay 2. There must be only one timing source configured.

For the looped timing mode, the system clock is derived from the received line signal. Therefore, the timing selection should be in loop timing mode for connections to higher order systems.

The IEEE C37.94 communications module cover removal procedure is as follows:

1. Remove the IEEE C37.94 module (type 2G, 2H, 76, or 77 module):

    The ejector/inserter clips located at the top and at the bottom of each module, must be pulled simultaneously in order to release the module for removal. Before performing this action, **control power must be removed from the relay**. The original location of the module should be recorded to help ensure that the same or replacement module is inserted into the correct slot.

2. Remove the module cover screw.

3. Remove the top cover by sliding it towards the rear and then lift it upwards.

4. Set the timing selection switches (channel 1, channel 2) to the desired timing modes (see description above).

5. Replace the top cover and the cover screw.

6. Re-insert the IEEE C37.94 module. Take care to ensure that the **correct** module type is inserted into the **correct** slot position. The ejector/inserter clips located at the top and at the bottom of each module must be in the disengaged position as the module is smoothly inserted into the slot. Once the clips have cleared the raised edge of the chassis, engage the clips simultaneously. When the clips have locked into position, the module will be fully inserted.

Figure 3–44: IEEE C37.94 TIMING SELECTION SWITCH SETTING

The UR-series C37.94SM communication modules (2A and 2B) are designed to interface with modified IEEE C37.94 compliant digital multiplexers or IEEE C37.94 compliant interface converters that have been converted from 820 nm multi-mode fiber optics to 1300 nm ELED single-mode fiber optics. The IEEE C37.94 standard defines a point-to-point optical link for synchronous data between a multiplexer and a teleprotection device. This data is typically 64 kbps, but the standard provides for speeds up to $64n$ kbps, where n = 1, 2,…, 12. The UR-series C37.94SM communication module is 64 kbps only with n fixed at 1. The frame is a valid International Telecommunications Union (ITU-T) recommended G.704 pattern from the standpoint of framing and data rate. The frame is 256 bits and is repeated at a frame rate of 8000 Hz, with a resultant bit rate of 2048 kbps.

The specifications for the module are as follows:

- Emulated IEEE standard: emulates C37.94 for 1×64 kbps optical fiber interface (modules set to n = 1 or 64 kbps).
- Fiber optic cable type: 9/125 μm core diameter optical fiber.
- Fiber optic mode: single-mode, ELED compatible with HP HFBR-1315T transmitter and HP HFBR-2316T receiver.
- Fiber optic cable length: up to 10 km.
- Fiber optic connector: type ST.
- Wavelength: 1300 ±40 nm.
- Connection: as per all fiber optic connections, a Tx to Rx connection is required.

The UR-series C37.94SM communication module can be connected *directly* to any compliant digital multiplexer that supports C37.94SM as shown below.
842757A1.CDR

It can also can be connected **directly** to any other UR-series relay with a C37.94SM module as shown below.
842758A1.CDR

The UR-series C37.94SM communication module has six (6) switches that are used to set the clock configuration. The functions of these control switches is shown below.

842753A1.CDR

For the internal timing mode, the system clock is generated internally. Therefore, the timing switch selection should be internal timing for relay 1 and loop timed for relay 2. There must be only one timing source configured.

For the looped timing mode, the system clock is derived from the received line signal. Therefore, the timing selection should be in loop timing mode for connections to higher order systems.

The C37.94SM communications module cover removal procedure is as follows:

1. Remove the C37.94SM module (modules 2A or 2B):

   The ejector/inserter clips located at the top and at the bottom of each module, must be pulled simultaneously in order to release the module for removal. Before performing this action, **control power must be removed from the relay**. The original location of the module should be recorded to help ensure that the same or replacement module is inserted into the correct slot.

2. Remove the module cover screw.

3. Remove the top cover by sliding it towards the rear and then lift it upwards.

4. Set the timing selection switches (channel 1, channel 2) to the desired timing modes (see description above).

5. Replace the top cover and the cover screw.

6. Re-insert the C37.94SM module. Take care to ensure that the **correct** module type is inserted into the **correct** slot position. The ejector/inserter clips located at the top and at the bottom of each module must be in the disengaged position as the module is smoothly inserted into the slot. Once the clips have cleared the raised edge of the chassis, engage the clips simultaneously. When the clips have locked into position, the module will be fully inserted.

Figure 3–45: C37.94SM TIMING SELECTION SWITCH SETTING

The type 2S and 2T embedded managed switch modules are supported by UR-series relays containing type 9S CPU modules with revisions 5.5x and higher. The modules communicate to the C60 through an internal Ethernet port (referred to as the UR port or port 7) and provide an additional six external Ethernet ports: two 10/100Base-T ports and four multimode ST 100Base-FX ports.

> **NOTE**
> The Ethernet switch module should be powered up before or at the same time as the C60. Otherwise, the switch module will not be detected on power up and the **EQUIPMENT MISMATCH: ORDERCODE XXX** self-test warning will be issued.

The type 2S and 2T managed Ethernet switch modules provide two 10/100Base-T and four multimode ST 100Base-FX external Ethernet ports accessible through the rear of the module. In addition, a serial console port is accessible from the front of the module (requires the front panel faceplate to be open).

The pin assignment for the console port signals is shown in the following table.

Table 3–6: CONSOLE PORT PIN ASSIGNMENT

PIN	SIGNAL	DESCRIPTION
1	CD	Carrier detect (not used)
2	RXD	Receive data (input)
3	TXD	Transmit data (output)
4	N/A	Not used
5	GND	Signal ground
6 to 9	N/A	Not used
Figure 3–46: MANAGED ETHERNET SWITCHES HARDWARE

3.4.3 MANAGED SWITCH LED INDICATORS

The 10/100Base-T and 100Base-FX ports have LED indicators to indicate the port status.

The 10/100Base-T ports have three LEDs to indicate connection speed, duplex mode, and link activity. The 100Base-FX ports have one LED to indicate linkup and activity.

Connection speed indicator (OFF = 10 Mbps; ON = 100 Mbps)
Link indicator (ON = link active; FLASHING = activity)
Duplex mode indicator (OFF = half-duplex; ON = full-duplex)

Link indicator (ON = link active; FLASHING = activity)

842868A2.CDR
Figure 3–47: ETHERNET SWITCH LED INDICATORS

3.4.4 CONFIGURING THE MANAGED ETHERNET SWITCH MODULE

A suitable IP/gateway and subnet mask must be assigned to both the switch and the UR relay for correct operation. The Switch has been shipped with a default IP address of 192.168.1.2 and a subnet mask of 255.255.255.0. Consult your network administrator to determine if the default IP address, subnet mask or default gateway needs to be modified.

⚠ **Do not connect to network while configuring the switch module.**
CAUTION

a) CONFIGURING THE SWITCH MODULE IP SETTINGS

In our example configuration of both the Switch's IP address and subnet mask must be changed to 3.94.247.229 and 255.255.252.0 respectively. The IP address, subnet mask and default gateway can be configured using either EnerVista UR Setup software, the Switch's Secure Web Management (SWM), or through the console port using CLI.

1. Select the **Settings > Product Setup > Communications > Ethernet Switch > Configure IP** menu item to open the Ethernet switch configuration window.
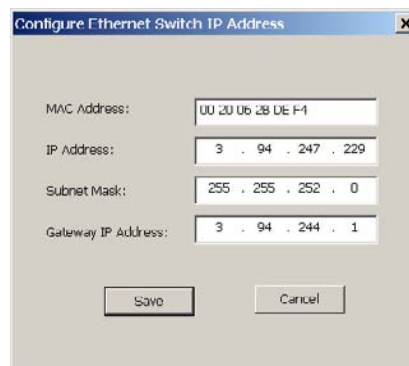

2.   Enter "3.94.247.229" in the **IP Address** field and "255.255.252.0" in the **Subnet Mask** field, then click **OK**.

The software will send the new settings to the C60 and prompt as follows when complete.

3.   Cycle power to the C60 and switch module to activate the new settings.

b) SAVING THE ETHERNET SWITCH SETTINGS TO A SETTINGS FILE

The C60 allows the settings information for the Ethernet switch module to be saved locally as a settings file. This file contains the advanced configuration details for the switch not contained within the standard C60 settings file.

This feature allows the switch module settings to be saved locally before performing firmware upgrades. Saving settings files is also highly recommended before making any change to the module configuration or creating new setting files.

The following procedure describes how to save local settings files for the Ethernet switch module.

1.   Select the desired device from site tree in the online window.

2.   Select the **Settings > Product Setup > Communications > Ethernet Switch > Ethernet Switch Settings File > Retreive Settings File** item from the device settings tree.

The system will request the name and destination path for the settings file.
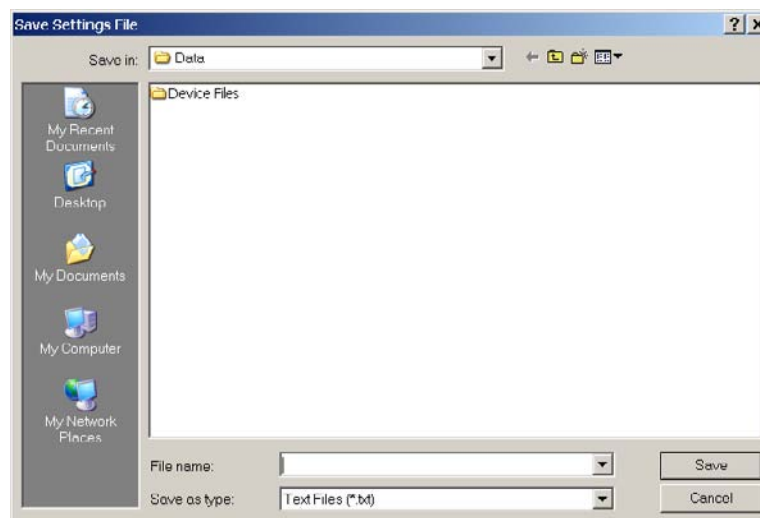

3.   Enter an appropriate folder and file name and click **Save**.

All settings files will be saved as text files and the corresponding file extension automatically assigned.

c) UPLOADING ETHERNET SWITCH SETTINGS FILES TO THE MODULE

The following procedure describes how to upload local settings files to the Ethernet switch module. It is highly recommended that the current settings are saved to a settings file before uploading a new settings file.

NOTE   It is highly recommended to place the switch offline while transferring setting files to the switch. When transferring settings files from one switch to another, the user must reconfigure the IP address.

1.   Select the desired device from site tree in the online window.

2.   Select the **Settings > Product Setup > Communications > Ethernet Switch > Ethernet Switch Settings File > Transfer Settings File** item from the device settings tree.

The system will request the name and destination path for the settings file.
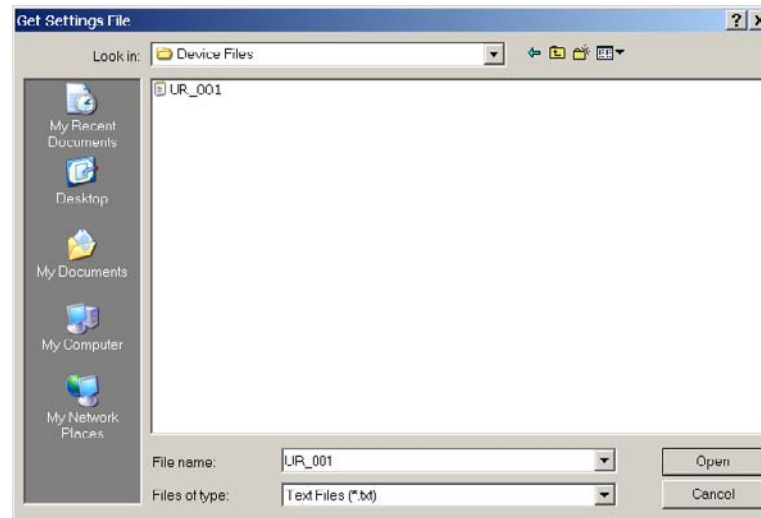

3. Navigate to the folder containing the Ethernet switch settings file, select the file, then click **Open**.

The settings file will be transferred to the Ethernet switch and the settings uploaded to the device.

3.4.5 UPLOADING C60 SWITCH MODULE FIRMWARE

a) DESCRIPTION

This section describes the process for upgrading firmware on a UR-2S or UR-2T switch module.

There are several ways of updating firmware on a switch module:

• Using the EnerVista UR Setup software.

• Serially using the C60 switch module console port.

• Using FTP or TFTP through the C60 switch module console port.

It is highly recommended to use the EnerVista UR Setup software to upgrade firmware on a C60 switch module.

> **NOTE**
> Firmware upgrades using the serial port, TFTP, and FTP are described in detail in the switch module manual.

b) SELECTING THE PROPER SWITCH FIRMWARE VERSION

The latest switch module firmware is available as a download from the GE Multilin web site. Use the following procedure to determine the version of firmware currently installed on your switch

1. Log into the switch using the EnerVista web interface.

> **NOTE**
> The default switch login ID is "manager" and the default password is "manager".

The firmware version installed on the switch will appear on the lower left corner of the screen.

Version: 2.1 beta   842869A1.CDR
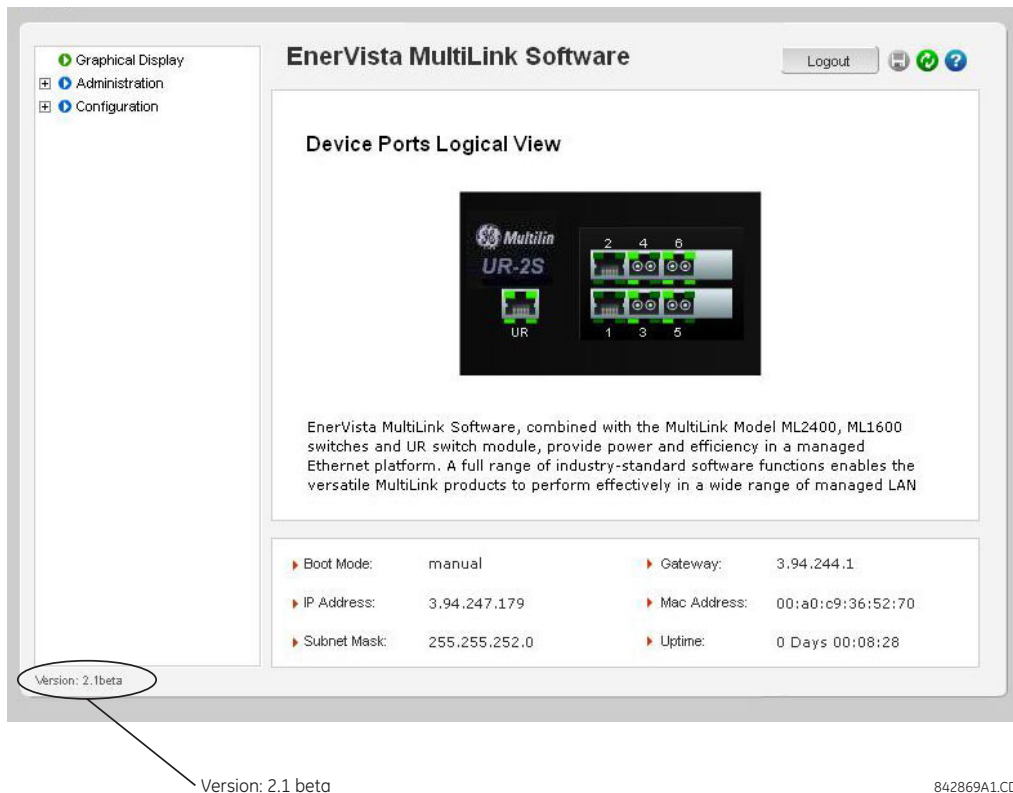

2. Using the EnerVista UR Setup program, select the **Settings > Product Setup > Communications > Ethernet Switch > Firmware Upload** menu item.

    The following popup screen will appear warning that the settings will be lost when the firmware is upgraded.
> **NOTE**
>
> It is highly recommended that you save the switch settings before upgrading the firmware.

3. After saving the settings file, proceed with the firmware upload by selecting **Yes** to the above warning.

    Another window will open, asking you to point to the location of the firmware file to be uploaded.

4.   Select the firmware file to be loaded on to the Switch, and select the **Open** option.

The following window will pop up, indicating that the firmware file transfer is in progress.
If the firmware load was successful, the following window will appear:
> **NOTE**
>
> The switch will automatically reboot after a successful firmware file transfer.

5.   Once the firmware has been successfully uploaded to the switch module, load the settings file using the procedure described earlier.

The following table provides details about Ethernet module self-test errors.

Be sure to enable the **ETHERNET SWITCH FAIL** setting in the **PRODUCT SETUP** ⇨⇩ **USER-PROGRAMMABLE SELF-TESTS** menu and the relevant **PORT 1 EVENTS** through **PORT 6 EVENTS** settings under the **PRODUCT SETUP** ⇨⇩ **COMMUNICATIONS** ⇨⇩ **ETHERNET SWITCH** menu.

Table 3–7: ETHERNET SWITCH SELF-TEST ERRORS

ACTIVATION SETTING (SET AS ENABLED)	EVENT NAME	EVENT CAUSE	POSSIBLE CAUSES
ETHERNET SWITCH FAIL	ETHERNET MODULE OFFLINE	No response has been received from the Ethernet module after five successive polling attempts.	• Loss of switch power. • IP/gateway/subnet. • Incompatibility between the CPU and the switch module. • UR port (port 7) configured incorrectly or blocked • Switch IP address assigned to another device in the same network.
PORT 1 EVENTS to PORT 6 EVENTS	ETHERNET PORT 1 OFFLINE to ETHERNET PORT 6 OFFLINE	An active Ethernet port has returned a FAILED status.	• Ethernet connection broken. • An inactive port's events have been enabled.
No setting required; the C60 will read the state of a general purpose input/output port on the main CPU upon power-up and create the error if there is a conflict between the input/output state and the order code.	EQUIPMENT MISMATCH: Card XXX Missing	The C60 has not detected the presence of the Ethernet switch via the bus board.	The C60 failed to see the switch module on power-up, because switch won't power up or is still powering up. To clear the fault, cycle power to the C60.

The EnerVista UR Setup software provides a graphical user interface (GUI) as one of two human interfaces to a UR device. The alternate human interface is implemented via the device's faceplate keypad and display (refer to the *Faceplate interface* section in this chapter).

The EnerVista UR Setup software provides a single facility to configure, monitor, maintain, and trouble-shoot the operation of relay functions, connected over local or wide area communication networks. It can be used while disconnected (off-line) or connected (on-line) to a UR device. In off-line mode, settings files can be created for eventual downloading to the device. In on-line mode, you can communicate with the device in real-time.

The EnerVista UR Setup software, provided with every C60 relay, can be run from any computer supporting Microsoft Windows[®] 95, 98, NT, 2000, ME, and XP. This chapter provides a summary of the basic EnerVista UR Setup software interface features. The EnerVista UR Setup Help File provides details for getting started and using the EnerVista UR Setup software interface.

To start using the EnerVista UR Setup software, a site definition and device definition must first be created. See the EnerVista UR Setup Help File or refer to the *Connecting EnerVista UR Setup with the C60* section in Chapter 1 for details.

4

a) ENGAGING A DEVICE

The EnerVista UR Setup software may be used in on-line mode (relay connected) to directly communicate with the C60 relay. Communicating relays are organized and grouped by communication interfaces and into sites. Sites may contain any number of relays selected from the UR-series of relays.

b) USING SETTINGS FILES

The EnerVista UR Setup software interface supports three ways of handling changes to relay settings:

- In off-line mode (relay disconnected) to create or edit relay settings files for later download to communicating relays.

- While connected to a communicating relay to directly modify any relay settings via relay data view windows, and then save the settings to the relay.

- You can create/edit settings files and then write them to the relay while the interface is connected to the relay.

Settings files are organized on the basis of file names assigned by the user. A settings file contains data pertaining to the following types of relay settings:

- Device definition

- Product setup

- System setup

- FlexLogic™

- Grouped elements

- Control elements

- Inputs/outputs

- Testing

Factory default values are supplied and can be restored after any changes.

c) CREATING AND EDITING FLEXLOGIC™

You can create or edit a FlexLogic™ equation in order to customize the relay. You can subsequently view the automatically generated logic diagram.

d) VIEWING ACTUAL VALUES

You can view real-time relay data such as input/output status and measured parameters.

e) VIEWING TRIGGERED EVENTS

While the interface is in either on-line or off-line mode, you can view and analyze data generated by triggered specified parameters, via one of the following:

- **Event Recorder facility:** The event recorder captures contextual data associated with the last 1024 events, listed in chronological order from most recent to oldest.

- **Oscillography facility:** The oscillography waveform traces and digital states are used to provide a visual display of power system and relay operation data captured during specific triggered events.

f) FILE SUPPORT

- **Execution:** Any EnerVista UR Setup file which is double clicked or opened will launch the application, or provide focus to the already opened application. If the file was a settings file (has a `URS` extension) which had been removed from the Settings List tree menu, it will be added back to the Settings List tree menu.

- **Drag and Drop:** The Site List and Settings List control bar windows are each mutually a drag source and a drop target for device-order-code-compatible files or individual menu items. Also, the Settings List control bar window and any Windows Explorer directory folder are each mutually a file drag source and drop target.

  New files which are dropped into the Settings List window are added to the tree which is automatically sorted alphabetically with respect to settings file names. Files or individual menu items which are dropped in the selected device menu in the Site List window will automatically be sent to the on-line communicating device.

g) FIRMWARE UPGRADES

The firmware of a C60 device can be upgraded, locally or remotely, via the EnerVista UR Setup software. The corresponding instructions are provided by the EnerVista UR Setup Help file under the topic "Upgrading Firmware".

> **NOTE**
>
> Modbus addresses assigned to firmware modules, features, settings, and corresponding data items (i.e. default values, minimum/maximum values, data type, and item size) may change slightly from version to version of firmware. The addresses are rearranged when new features are added or existing features are enhanced or modified. The **EEPROM DATA ERROR** message displayed after upgrading/downgrading the firmware is a resettable, self-test message intended to inform users that the Modbus addresses have changed with the upgraded firmware. This message does not signal any problems when appearing after firmware upgrades.

The EnerVista UR Setup software main window supports the following primary display components:

1. Title bar which shows the pathname of the active data view.

2. Main window menu bar.

3. Main window tool bar.

4. Site list control bar window.

5. Settings list control bar window.

6. Device data view windows, with common tool bar.

7. Settings file data view windows, with common tool bar.

8. Workspace area with data view tabs.

9. Status bar.

10. Quick action hot links.
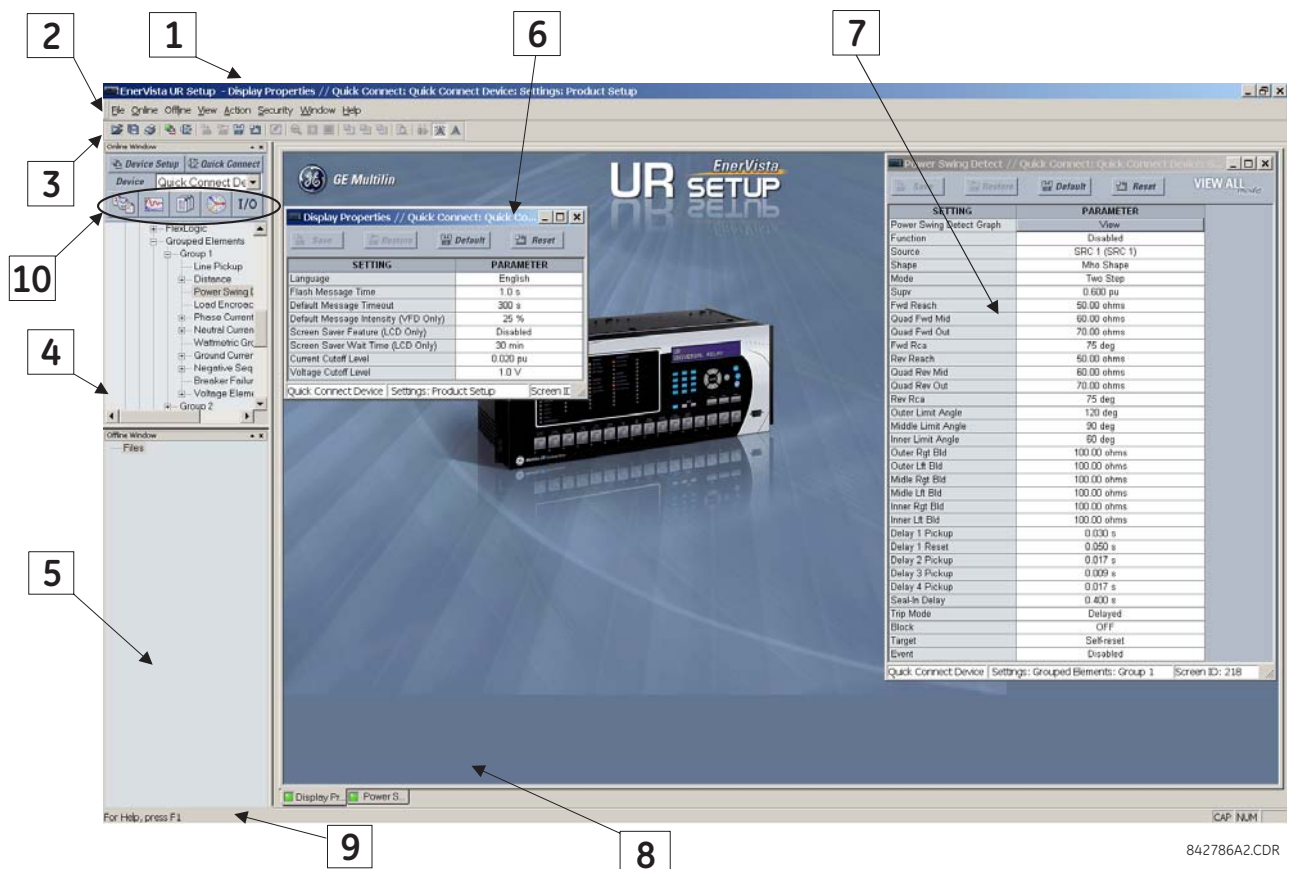

Figure 4–1: ENERVISTA UR SETUP SOFTWARE MAIN WINDOW

Setting file templates simplify the configuration and commissioning of multiple relays that protect similar assets. An example of this is a substation that has ten similar feeders protected by ten UR-series F60 relays.

In these situations, typically 90% or greater of the settings are identical between all devices. The templates feature allows engineers to configure and test these common settings, then lock them so they are not available to users. For example, these locked down settings can be hidden from view for field engineers, allowing them to quickly identify and concentrate on the specific settings.

The remaining settings (typically 10% or less) can be specified as editable and be made available to field engineers installing the devices. These will be settings such as protection element pickup values and CT and VT ratios.

The settings template mode allows the user to define which settings will be visible in EnerVista UR Setup. Settings templates can be applied to both settings files (settings file templates) and online devices (online settings templates). The functionality is identical for both purposes.

> The settings template feature requires that *both* the EnerVista UR Setup software and the C60 firmware are at versions 5.40 or higher.

a) ENABLING THE SETTINGS TEMPLATE

The settings file template feature is disabled by default. The following procedure describes how to enable the settings template for UR-series settings files.

1. Select a settings file from the offline window of the EnerVista UR Setup main screen.

2. Right-click on the selected device or settings file and select the **Template Mode > Create Template** option.

The settings file template is now enabled and the file tree displayed in light blue. The settings file is now in template editing mode.

Alternatively, the settings template can also be applied to online settings. The following procedure describes this process.

1. Select an installed device from the online window of the EnerVista UR Setup main screen.

2. Right-click on the selected device and select the **Template Mode > Create Template** option.

   The software will prompt for a template password. This password is required to use the template feature and must be at least four characters in length.

3. Enter and re-enter the new password, then click **OK** to continue.

The online settings template is now enabled. The device is now in template editing mode.

b) EDITING THE SETTINGS TEMPLATE

The settings template editing feature allows the user to specify which settings are available for viewing and modification in EnerVista UR Setup. By default, all settings except the FlexLogic™ equation editor settings are locked.

1. Select an installed device or a settings file from the tree menu on the left of the EnerVista UR Setup main screen.

2. Select the **Template Mode > Edit Template** option to place the device in template editing mode.

3. Enter the template password then click **OK**.

4. Open the relevant settings windows that contain settings to be specified as viewable.

By default, all settings are specified as locked and displayed against a grey background. The icon on the upper right of the settings window will also indicate that EnerVista UR Setup is in **EDIT mode**. The following example shows the phase time overcurrent settings window in edit mode.
Figure 4–2: SETTINGS TEMPLATE VIEW, ALL SETTINGS SPECIFIED AS LOCKED

5. Specify which settings to make viewable by clicking on them.

    The setting available to view will be displayed against a yellow background as shown below.
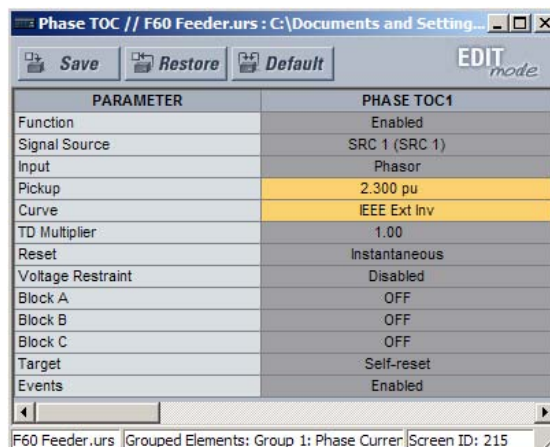

Figure 4–3: SETTINGS TEMPLATE VIEW, TWO SETTINGS SPECIFIED AS EDITABLE

6. Click on **Save** to save changes to the settings template.

7. Proceed through the settings tree to specify all viewable settings.

c) ADDING PASSWORD PROTECTION TO A TEMPLATE

It is highly recommended that templates be saved with password protection to maximize security.

The following procedure describes how to add password protection to a settings file template.

1. Select a settings file from the offline window on the left of the EnerVista UR Setup main screen.

2. Selecting the **Template Mode > Password Protect Template** option.

The software will prompt for a template password. This password must be at least four characters in length.

3. Enter and re-enter the new password, then click **OK** to continue.

The settings file template is now secured with password protection.

> **NOTE**
> When templates are created for online settings, the password is added during the initial template creation step. It does not need to be added after the template is created.

d) VIEWING THE SETTINGS TEMPLATE
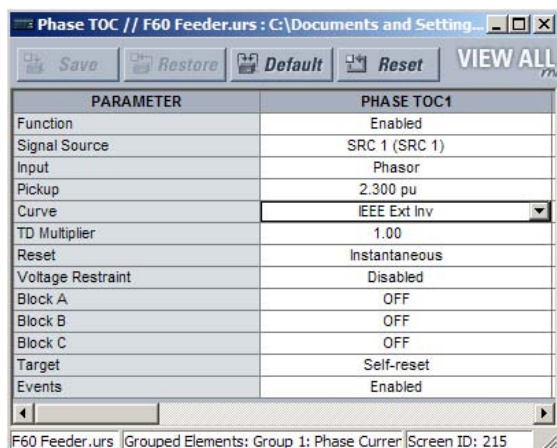

Once all necessary settings are specified for viewing, users are able to view the settings template on the online device or settings file. There are two ways to specify the settings view with the settings template feature:

*   Display only those settings available for editing.

*   Display all settings, with settings not available for editing greyed-out.

Use the following procedure to only display settings available for editing.

1. Select an installed device or a settings file from the tree menu on the left of the EnerVista UR Setup main screen.

2. Apply the template by selecting the **Template Mode > View In Template Mode** option.

3. Enter the template password then click **OK** to apply the template.
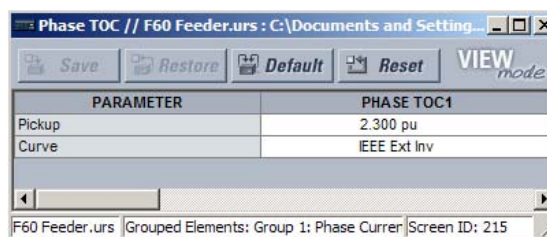

Once the template has been applied, users will only be able to view and edit the settings specified by the template. The effect of applying the template to the phase time overcurrent settings is shown below.

Phase time overcurrent settings window without template applied.

Phase time overcurrent window with template applied via the **Template Mode > View In Template Mode** command. The template specifies that only the Pickup and Curve settings be available.

842858A1.CDR

Figure 4–4: APPLYING TEMPLATES VIA THE VIEW IN TEMPLATE MODE COMMAND

Viewing the settings in template mode also modifies the settings tree, showing only the settings categories that contain editable settings. The effect of applying the template to a typical settings tree view is shown below.
Typical settings tree view without template applied.
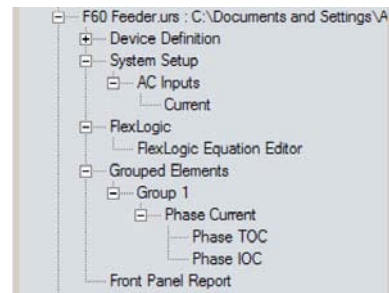

Typical settings tree view with template applied via the **Template Mode > View In Template Mode** command.

842860A1.CDR

Figure 4–5: APPLYING TEMPLATES VIA THE VIEW IN TEMPLATE MODE SETTINGS COMMAND

Use the following procedure to display settings available for editing and settings locked by the template.

1.   Select an installed device or a settings file from the tree menu on the left of the EnerVista UR Setup main screen.

2.   Apply the template by selecting the **Template Mode > View All Settings** option.

3.   Enter the template password then click **OK** to apply the template.

Once the template has been applied, users will only be able to edit the settings specified by the template, but all settings will be shown. The effect of applying the template to the phase time overcurrent settings is shown below.
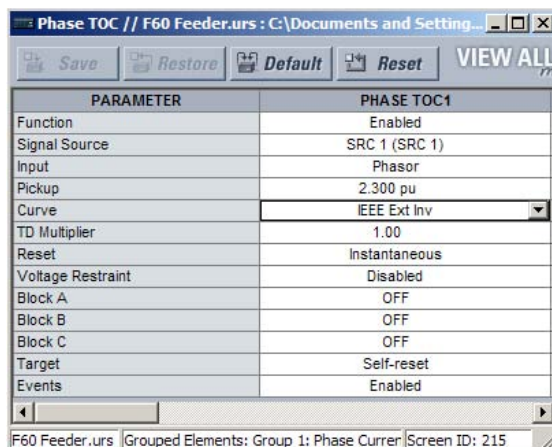

Phase time overcurrent settings window without template applied.
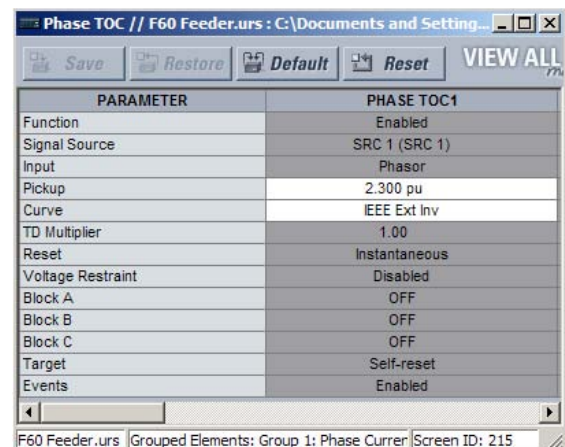

Phase time overcurrent window with template applied via the **Template Mode > View All Settings** command. The template specifies that only the Pickup and Curve settings be available.

842859A1.CDR

Figure 4–6: APPLYING TEMPLATES VIA THE VIEW ALL SETTINGS COMMAND

e) REMOVING THE SETTINGS TEMPLATE

It may be necessary at some point to remove a settings template. Once a template is removed, it cannot be reapplied and it will be necessary to define a new settings template.

1.   Select an installed device or settings file from the tree menu on the left of the EnerVista UR Setup main screen.

2.   Select the **Template Mode > Remove Settings Template** option.

3.   Enter the template password and click **OK** to continue.

4.   Verify one more time that you wish to remove the template by clicking **Yes**.

The EnerVista software will remove all template information and all settings will be available.

The UR allows users to secure parts or all of a FlexLogic™ equation, preventing unauthorized viewing or modification of critical FlexLogic™ applications. This is accomplished using the settings template feature to lock individual entries within FlexLogic™ equations.

Secured FlexLogic™ equations will remain secure when files are sent to and retrieved from any UR-series device.

a) LOCKING FLEXLOGIC™ EQUATION ENTRIES

The following procedure describes how to lock individual entries of a FlexLogic™ equation.

1.   Right-click the settings file or online device and select the **Template Mode > Create Template** item to enable the settings template feature.

2.   Select the **FlexLogic > FlexLogic Equation Editor** settings menu item.

By default, all FlexLogic™ entries are specified as viewable and displayed against a yellow background. The icon on the upper right of the window will also indicate that EnerVista UR Setup is in **EDIT mode**.

3.   Specify which entries to lock by clicking on them.

The locked entries will be displayed against a grey background as shown in the example below.
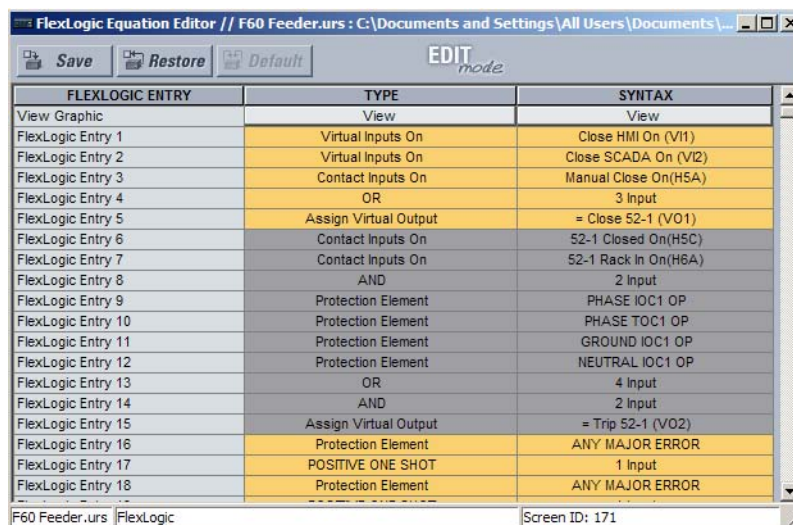

Figure 4–7: LOCKING FLEXLOGIC™ ENTRIES IN EDIT MODE

4.   Click on **Save** to save and apply changes to the settings template.

5.   Select the **Template Mode > View In Template Mode** option to view the template.

6.   Apply a password to the template then click **OK** to secure the FlexLogic™ equation.

Once the template has been applied, users will only be able to view and edit the FlexLogic™ entries not locked by the template. The effect of applying the template to the FlexLogic™ entries in the above procedure is shown below.

Typical FlexLogic™ entries without template applied.

Typical FlexLogic™ entries locked with template via the **Template Mode > View In Template Mode** command.

842861A1.CDR

Figure 4–8: LOCKING FLEXLOGIC ENTRIES THROUGH SETTING TEMPLATES

The FlexLogic™ entries are also shown as locked in the graphical view (as shown below) and on the front panel display.
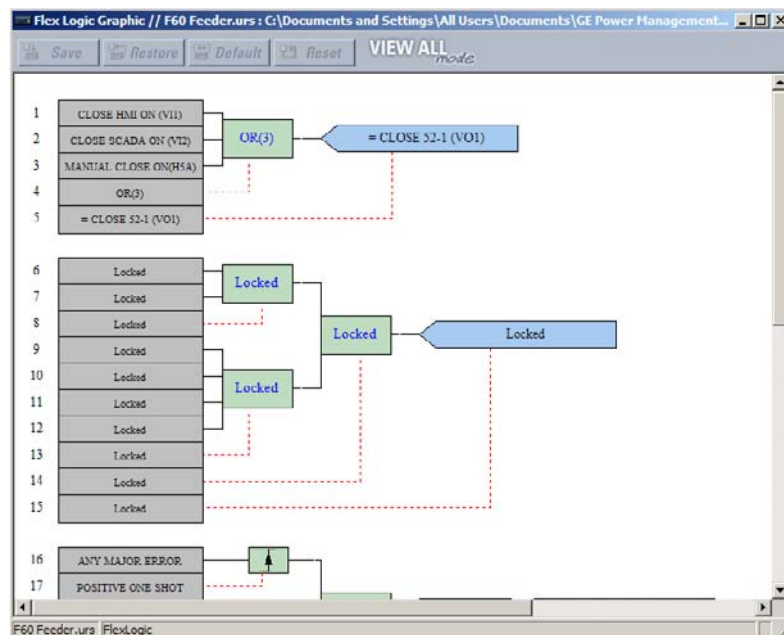

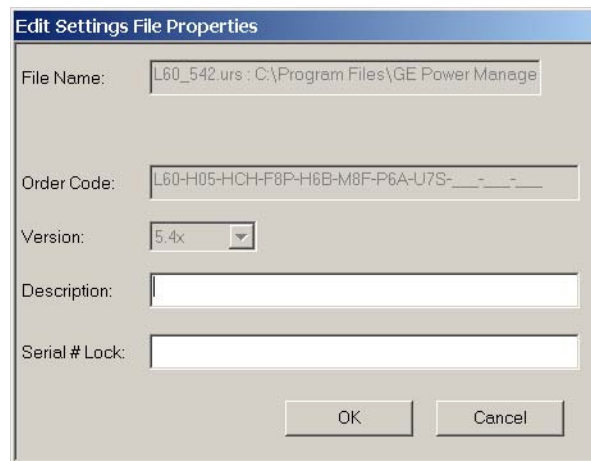

Figure 4–9: SECURED FLEXLOGIC™ IN GRAPHICAL VIEW

b) LOCKING FLEXLOGIC™ EQUATIONS TO A SERIAL NUMBER

A settings file and associated FlexLogic™ equations can also be locked to a specific UR serial number. Once the desired FlexLogic™ entries in a settings file have been secured, use the following procedure to lock the settings file to a specific serial number.

1. Select the settings file in the offline window.

2. Right-click on the file and select the **Edit Settings File Properties** item.

The following window is displayed.

Figure 4–10: TYPICAL SETTINGS FILE PROPERTIES WINDOW

3.   Enter the serial number of the C60 device to lock to the settings file in the **Serial # Lock** field.

The settings file and corresponding secure FlexLogic™ equations are now locked to the C60 device specified by the serial number.

4.2.3 SETTINGS FILE TRACEABILITY

A traceability feature for settings files allows the user to quickly determine if the settings in a C60 device have been changed since the time of installation from a settings file. When a settings file is transfered to a C60 device, the date, time, and serial number of the C60 are sent back to EnerVista UR Setup and added to the settings file on the local PC. This information can be compared with the C60 actual values at any later date to determine if security has been compromised.

The traceability information is only included in the settings file if a complete settings file is either transferred to the C60 device or obtained from the C60 device. Any partial settings transfers by way of drag and drop do not add the traceability information to the settings file.
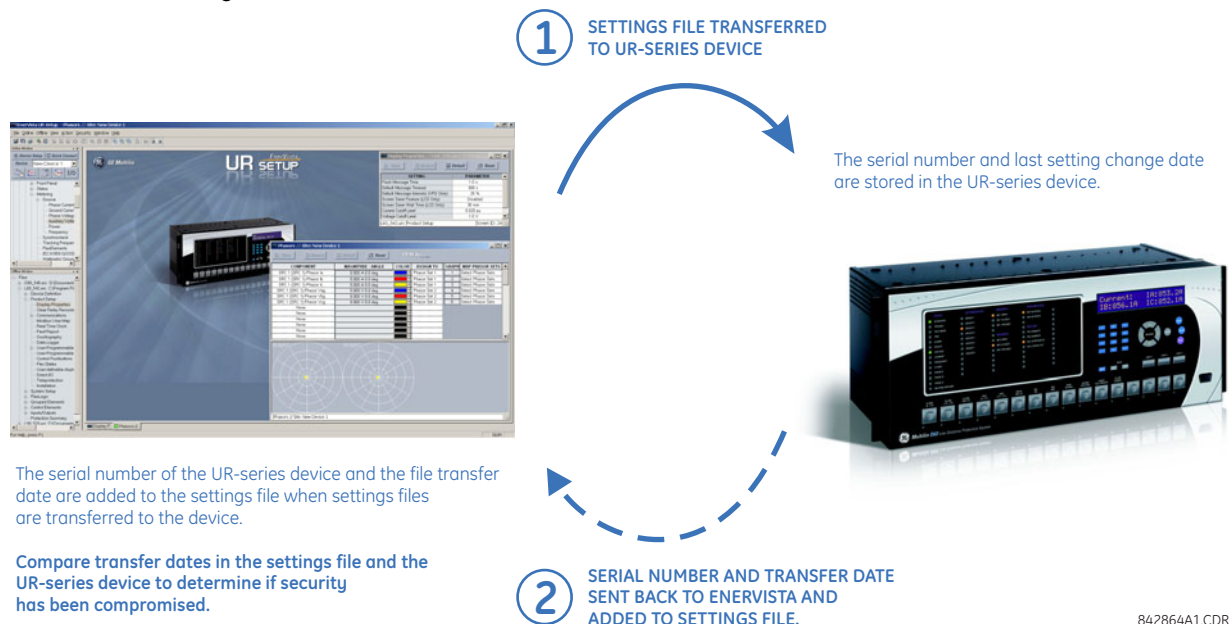

Figure 4–11: SETTINGS FILE TRACEABILITY MECHANISM

With respect to the above diagram, the traceability feature is used as follows.

1. The transfer date of a setting file written to a C60 is logged in the relay and can be viewed via EnerVista UR Setup or the front panel display. Likewise, the transfer date of a setting file saved to a local PC is logged in EnerVista UR Setup.

2. Comparing the dates stored in the relay and on the settings file at any time in the future will indicate if any changes have been made to the relay configuration since the settings file was saved.

a) SETTINGS FILE TRACEABILITY INFORMATION

The serial number and file transfer date are saved in the settings files when they sent to an C60 device.

The C60 serial number and file transfer date are included in the settings file device definition within the EnerVista UR Setup offline window as shown in the example below.
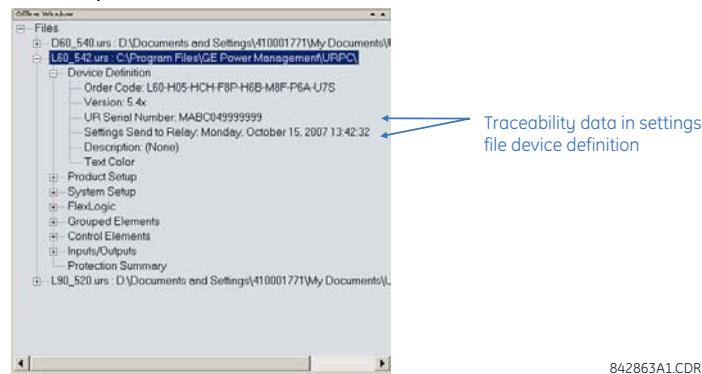

Figure 4–12: DEVICE DEFINITION SHOWING TRACEABILITY DATA

This information is also available in printed settings file reports as shown in the example below.
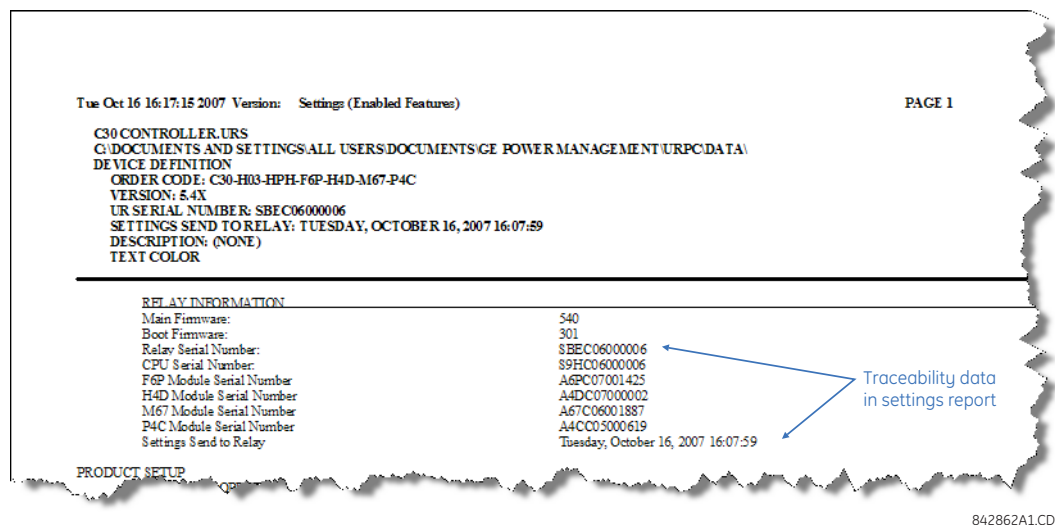

Figure 4–13: SETTINGS FILE REPORT SHOWING TRACEABILITY DATA

b) ONLINE DEVICE TRACEABILITY INFORMATION

The C60 serial number and file transfer date are available for an online device through the actual values. Select the **Actual Values > Product Info > Model Information** menu item within the EnerVista UR Setup online window as shown in the example below.

842865A1.CDR

Figure 4–14: TRACEABILITY DATA IN ACTUAL VALUES WINDOW

This infomormation if also available from the front panel display through the following actual values:

ACTUAL VALUES ⇨⇩ PRODUCT INFO ⇨ MODEL INFORMATION ⇨⇩ SERIAL NUMBER
ACTUAL VALUES ⇨⇩ PRODUCT INFO ⇨ MODEL INFORMATION ⇨⇩ LAST SETTING CHANGE

c) ADDITIONAL TRACEABILITY RULES

The following additional rules apply for the traceability feature

- If the user changes any settings within the settings file in the offline window, then the traceability information is removed from the settings file.

- If the user creates a new settings file, then no traceability information is included in the settings file.

- If the user converts an existing settings file to another revision, then any existing traceability information is removed from the settings file.

- If the user duplicates an existing settings file, then any traceability information is transferred to the duplicate settings file.

a) ENHANCED FACEPLATE

The front panel interface is one of two supported interfaces, the other interface being EnerVista UR Setup software. The front panel interface consists of LED panels, an RS232 port, keypad, LCD display, control pushbuttons, and optional user-programmable pushbuttons.

The faceplate is hinged to allow easy access to the removable modules.

Figure 4–15: UR-SERIES ENHANCED FACEPLATE

b) STANDARD FACEPLATE

The front panel interface is one of two supported interfaces, the other interface being EnerVista UR Setup software. The front panel interface consists of LED panels, an RS232 port, keypad, LCD display, control pushbuttons, and optional user-programmable pushbuttons.

The faceplate is hinged to allow easy access to the removable modules. There is also a removable dust cover that fits over the faceplate which must be removed in order to access the keypad panel. The following figure shows the horizontal arrangement of the faceplate panels.
Figure 4–16: UR-SERIES STANDARD HORIZONTAL FACEPLATE PANELS

The following figure shows the vertical arrangement of the faceplate panels for relays ordered with the vertical option.
Figure 4–17: UR-SERIES STANDARD VERTICAL FACEPLATE PANELS

4.3.2 LED INDICATORS

a) ENHANCED FACEPLATE

The enhanced front panel display provides five columns of LED indicators. The first column contains 14 status and event cause LEDs, and the next four columns contain the 48 user-programmable LEDs.

The RESET key is used to reset any latched LED indicator or target message, once the condition has been cleared (these latched conditions can also be reset via the **SETTINGS** ⇨⇩ **INPUT/OUTPUTS** ⇨⇩ **RESETTING** menu). The RS232 port is intended for connection to a portable PC.

The USER keys are used by the breaker control feature.

Figure 4–18: TYPICAL LED INDICATOR PANEL FOR ENHANCED FACEPLATE

The status indicators in the first column are described below.

- **IN SERVICE**: This LED indicates that control power is applied, all monitored inputs, outputs, and internal systems are OK, and that the device has been programmed.

- **TROUBLE**: This LED indicates that the relay has detected an internal problem.

- **TEST MODE**: This LED indicates that the relay is in test mode.

- **TRIP**: This LED indicates that the FlexLogic™ operand serving as a trip switch has operated. This indicator always latches; as such, a reset command must be initiated to allow the latch to be reset.

- **ALARM**: This LED indicates that the FlexLogic™ operand serving as an alarm switch has operated. This indicator is never latched.

- **PICKUP**: This LED indicates that an element is picked up. This indicator is never latched.

The event cause indicators in the first column are described below. These indicate the input type that was involved in a condition detected by an element that is operated or has a latched flag waiting to be reset.

- **VOLTAGE**: This LED indicates voltage was involved.

- **CURRENT**: This LED indicates current was involved.

- **FREQUENCY**: This LED indicates frequency was involved.

- **OTHER**: This LED indicates a composite function was involved.

- **PHASE A**: This LED indicates phase A was involved.

- **PHASE B**: This LED indicates phase B was involved.

- **PHASE C**: This LED indicates phase C was involved.

- **NEUTRAL/GROUND**: This LED indicates that neutral or ground was involved.

The user-programmable LEDs consist of 48 amber LED indicators in four columns. The operation of these LEDs is user-defined. Support for applying a customized label beside every LED is provided. Default labels are shipped in the label package of every C60, together with custom templates. The default labels can be replaced by user-printed labels.

User customization of LED operation is of maximum benefit in installations where languages other than English are used to communicate with operators. Refer to the *User-programmable LEDs* section in chapter 5 for the settings used to program the operation of the LEDs on these panels.

b) STANDARD FACEPLATE

The standar faceplate consists of three panels with LED indicators, keys, and a communications port. The RESET key is used to reset any latched LED indicator or target message, once the condition has been cleared (these latched conditions can also be reset via the **SETTINGS ⇨⇩ INPUT/OUTPUTS ⇨⇩ RESETTING** menu). The RS232 port is intended for connection to a portable PC.

The USER keys are used by the breaker control feature.

842781A1.CDR
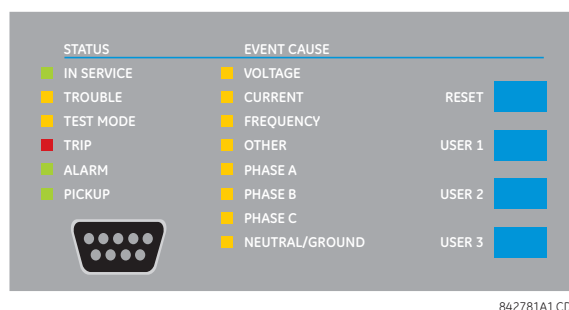

Figure 4–19: LED PANEL 1

STATUS INDICATORS:

- **IN SERVICE**: Indicates that control power is applied; all monitored inputs/outputs and internal systems are OK; the relay has been programmed.

- **TROUBLE**: Indicates that the relay has detected an internal problem.

- **TEST MODE**: Indicates that the relay is in test mode.

*   **TRIP**: Indicates that the selected FlexLogic™ operand serving as a Trip switch has operated. This indicator always latches; the reset command must be initiated to allow the latch to be reset.

*   **ALARM**: Indicates that the selected FlexLogic™ operand serving as an Alarm switch has operated. This indicator is never latched.

*   **PICKUP**: Indicates that an element is picked up. This indicator is never latched.

EVENT CAUSE INDICATORS:

These indicate the input type that was involved in a condition detected by an element that is operated or has a latched flag waiting to be reset.

*   **VOLTAGE**: Indicates voltage was involved.

*   **CURRENT**: Indicates current was involved.

*   **FREQUENCY**: Indicates frequency was involved.

*   **OTHER**: Indicates a composite function was involved.

*   **PHASE A**: Indicates phase A was involved.

*   **PHASE B**: Indicates phase B was involved.

*   **PHASE C**: Indicates phase C was involved.

*   **NEUTRAL/GROUND**: Indicates that neutral or ground was involved.

USER-PROGRAMMABLE INDICATORS:

The second and third provide 48 amber LED indicators whose operation is controlled by the user. Support for applying a customized label beside every LED is provided.

User customization of LED operation is of maximum benefit in installations where languages other than English are used to communicate with operators. Refer to the *User-programmable LEDs* section in chapter 5 for the settings used to program the operation of the LEDs on these panels.
842782A1.CDR

Figure 4–20: LED PANELS 2 AND 3 (INDEX TEMPLATE)

DEFAULT LABELS FOR LED PANEL 2:

The default labels are intended to represent:

*   **GROUP 1...6**: The illuminated GROUP is the active settings group.

*   **BREAKER 1(2) OPEN**: The breaker is open.

*   **BREAKER 1(2) CLOSED**: The breaker is closed.

*   **BREAKER 1(2) TROUBLE**: A problem related to the breaker has been detected.

*   **SYNCHROCHECK NO1(2) IN-SYNCH**: Voltages have satisfied the synchrocheck element.

*   **RECLOSE ENABLED**: The recloser is operational.

*   **RECLOSE DISABLED**: The recloser is not operational.

*   **RECLOSE IN PROGRESS**: A reclose operation is in progress.

*   **RECLOSE LOCKED OUT**: The recloser is not operational and requires a reset.

> **NOTE**
>
> **Firmware revisions 2.9x and earlier support eight user setting groups; revisions 3.0x and higher support six setting groups. For convenience of users using earlier firmware revisions, the relay panel shows eight setting groups. Please note that the LEDs, despite their default labels, are fully user-programmable.**

The relay is shipped with the default label for the LED panel 2. The LEDs, however, are not pre-programmed. To match the pre-printed label, the LED settings must be entered as shown in the *User-programmable LEDs* section of chapter 5. The LEDs are fully user-programmable. The default labels can be replaced by user-printed labels for both panels as explained in the following section.

842784A1.CDR

Figure 4–21: LED PANEL 2 (DEFAULT LABELS)

4.3.3 CUSTOM LABELING OF LEDS

a) ENHANCED FACEPLATE

The following procedure requires the pre-requisites listed below.

- EnerVista UR Setup software is installed and operational.
- The C60 settings have been saved to a settings file.
- The C60 front panel label cutout sheet (GE Multilin part number 1006-0047) has been downloaded from http://www.GEindustrial.com/multilin/support/ur and printed.
- Small-bladed knife.

This procedure describes how to create custom LED labels for the enhanced front panel display.

1. Start the EnerVista UR Setup software.

2.   Select the **Front Panel Report** item at the bottom of the menu tree for the settings file. The front panel report window will be displayed.
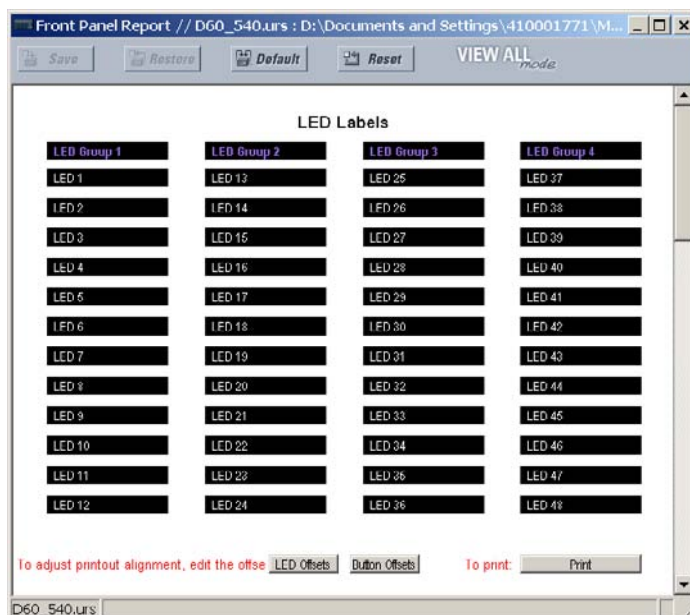

Figure 4–22: FRONT PANEL REPORT WINDOW

3.   Enter the text to appear next to each LED and above each user-programmable pushbuttons in the fields provided.

4.   Feed the C60 front panel label cutout sheet into a printer and press the **Print** button in the front panel report window.

5.   When printing is complete, fold the sheet along the perforated lines and punch out the labels.

6.   Remove the C60 label insert tool from the package and bend the tabs as described in the following procedures. These tabs will be used for removal of the default and custom LED labels.

> **NOTE**
>
> **It is important that the tool be used EXACTLY as shown below, with the printed side containing the GE part number facing the user.**

The label package shipped with every C60 contains the three default labels shown below, the custom label template sheet, and the label removal tool.

If the default labels are suitable for your application, insert them in the appropriate slots and program the LEDs to match them. If you require custom labels, follow the procedures below to remove the original labels and insert the new ones.

The following procedure describes how to setup and use the label removal tool.

1.   Bend the tabs at the left end of the tool upwards as shown below.

2. Bend the tab at the center of the tool tail as shown below.
The following procedure describes how to remove the LED labels from the C60 enhanced front panel and insert the custom labels.

1. Use the knife to lift the LED label and slide the label tool underneath. Make sure the bent tabs are pointing away from the relay.

4

2. Slide the label tool under the LED label until the tabs snap out as shown below. This will attach the label tool to the LED label.
3.   Remove the tool and attached LED label as shown below.

4.   Slide the new LED label inside the pocket until the text is properly aligned with the LEDs, as shown below.

The following procedure describes how to remove the user-programmable pushbutton labels from the C60 enhanced front panel and insert the custom labels.

1.   Use the knife to lift the pushbutton label and slide the tail of the label tool underneath, as shown below. Make sure the bent tab is pointing away from the relay.

2. Slide the label tool under the user-programmable pushbutton label until the tabs snap out as shown below. This will attach the label tool to the user-programmable pushbutton label.

3. Remove the tool and attached user-programmable pushbutton label as shown below.

4

4. Slide the new user-programmable pushbutton label inside the pocket until the text is properly aligned with the buttons, as shown below.

b) STANDARD FACEPLATE

Custom labeling of an LED-only panel is facilitated through a Microsoft Word file available from the following URL:

http://www.GEindustrial.com/multilin/support/ur/

This file provides templates and instructions for creating appropriate labeling for the LED panel. The following procedures are contained in the downloadable file. The panel templates provide relative LED locations and located example text (x) edit boxes. The following procedure demonstrates how to install/uninstall the custom panel labeling.

1. Remove the clear Lexan Front Cover (GE Multilin part number: 1501-0014).

Push in
and gently lift
up the cover.

842771A1.CDR
2. Pop out the LED module and/or the blank module with a screwdriver as shown below. Be careful not to damage the plastic covers.

842722A1.CDR
3. Place the left side of the customized module back to the front panel frame, then snap back the right side.

4. Put the clear Lexan front cover back into place.

The following items are required to customize the C60 display module:

- Black and white or color printer (color preferred).
- Microsoft Word 97 or later software for editing the template.
- 1 each of: 8.5" x 11" white paper, exacto knife, ruler, custom display module (GE Multilin Part Number: 1516-0069), and a custom module cover (GE Multilin Part Number: 1502-0015).

The following procedure describes how to customize the C60 display module:

1. Open the LED panel customization template with Microsoft Word. Add text in places of the **LED x** text placeholders on the template(s). Delete unused place holders as required.

2. When complete, save the Word file to your local PC for future use.

3. Print the template(s) to a local printer.

4. From the printout, cut-out the Background Template from the three windows, using the cropmarks as a guide.

5. Put the Background Template on top of the custom display module (GE Multilin Part Number: 1513-0069) and snap the clear custom module cover (GE Multilin Part Number: 1502-0015) over it and the templates.

4.3.4 DISPLAY

All messages are displayed on a 2 × 20 backlit liquid crystal display (LCD) to make them visible under poor lighting conditions. Messages are descriptive and should not require the aid of an instruction manual for deciphering. While the keypad and display are not actively being used, the display will default to user-defined messages. Any high priority event driven message will automatically override the default message and appear on the display.

4.3.5 KEYPAD

Display messages are organized into pages under the following headings: actual values, settings, commands, and targets. The MENU key navigates through these pages. Each heading page is broken down further into logical subgroups.

The MESSAGE keys navigate through the subgroups. The VALUE keys scroll increment or decrement numerical setting values when in programming mode. These keys also scroll through alphanumeric values in the text edit mode. Alternatively, values may also be entered with the numeric keypad.

The decimal key initiates and advance to the next character in text edit mode or enters a decimal point. The HELP key may be pressed at any time for context sensitive help messages. The ENTER key stores altered setting values.

4.3.6 BREAKER CONTROL

a) INTRODUCTION

The C60 can interface with associated circuit breakers. In many cases the application monitors the state of the breaker, which can be presented on faceplate LEDs, along with a breaker trouble indication. Breaker operations can be manually initiated from faceplate keypad or automatically initiated from a FlexLogic™ operand. A setting is provided to assign names to each breaker; this user-assigned name is used for the display of related flash messages. These features are provided for two breakers; the user may use only those portions of the design relevant to a single breaker, which must be breaker 1.

For the following discussion it is assumed the **SETTINGS ⇨⇩ SYSTEM SETUP ⇨⇩ BREAKERS ⇨ BREAKER 1(2) ⇨ BREAKER FUNCTION** setting is "Enabled" for each breaker.

b) CONTROL MODE SELECTION AND MONITORING

Installations may require that a breaker is operated in the three-pole only mode (3-pole), or in the one and three-pole (1-pole) mode, selected by setting. If the mode is selected as three-pole, a single input tracks the breaker open or closed position. If the mode is selected as one-pole, all three breaker pole states must be input to the relay. These inputs must be in agreement to indicate the position of the breaker.

For the following discussion it is assumed the **SETTINGS ⇨⇩ SYSTEM SETUP ⇨⇩ BREAKERS ⇨ BREAKER 1(2) ⇨⇩ BREAKER 1(2) PUSH BUTTON CONTROL** setting is "Enabled" for each breaker.

c) FACEPLATE (USER KEY) CONTROL

After the 30 minute interval during which command functions are permitted after a correct command password, the user cannot open or close a breaker via the keypad. The following discussions begin from the not-permitted state.

d) CONTROL OF TWO BREAKERS

For the following example setup, the `(Name)` field represents the user-programmed variable name.

For this application (setup shown below), the relay is connected and programmed for both breaker 1 and breaker 2. The USER 1 key performs the selection of which breaker is to be operated by the USER 2 and USER 3 keys. The USER 2 key is used to manually close the breaker and the USER 3 key is used to manually open the breaker.

```
ENTER COMMAND
PASSWORD
```
This message appears when the USER 1, USER 2, or USER 3 key is pressed and a **COMMAND PASSWORD** is required; i.e. if **COMMAND PASSWORD** is enabled and no commands have been issued within the last 30 minutes.

```
      Press USER 1
   To Select Breaker
```
This message appears if the correct password is entered or if none is required. This message will be maintained for 30 seconds or until the USER 1 key is pressed again.

```
BKR1-(Name) SELECTED
USER 2=CLS/USER 3=OP
```
This message is displayed after the USER 1 key is pressed for the second time. Three possible actions can be performed from this state within 30 seconds as per items **(1)**, **(2)** and **(3)** below:

(1)
```
   USER 2 OFF/ON
To Close BKR1-(Name)
```
If the USER 2 key is pressed, this message appears for 20 seconds. If the USER 2 key is pressed again within that time, a signal is created that can be programmed to operate an output relay to close breaker 1.

(2)
```
   USER 3 OFF/ON
To Open BKR1-(Name)
```
If the USER 3 key is pressed, this message appears for 20 seconds. If the USER 3 key is pressed again within that time, a signal is created that can be programmed to operate an output relay to open breaker 1.

(3)
```
BKR2-(Name) SELECTED
USER 2=CLS/USER 3=OP
```
If the USER 1 key is pressed at this step, this message appears showing that a different breaker is selected. Three possible actions can be performed from this state as per **(1)**, **(2)** and **(3)**. Repeatedly pressing the USER 1 key alternates between available breakers. Pressing keys other than USER 1, 2 or 3 at any time aborts the breaker control function.

e) CONTROL OF ONE BREAKER

For this application the relay is connected and programmed for breaker 1 only. Operation for this application is identical to that described above for two breakers.

4.3.7 MENUS

a) NAVIGATION

Press the MENU key to select the desired header display page (top-level menu). The header title appears momentarily followed by a header display page menu item. Each press of the MENU key advances through the following main heading pages:

- Actual values.
- Settings.
- Commands.
- Targets.
- User displays (when enabled).

b) HIERARCHY

The setting and actual value messages are arranged hierarchically. The header display pages are indicated by double scroll bar characters (■■), while sub-header pages are indicated by single scroll bar characters (■). The header display pages represent the highest level of the hierarchy and the sub-header display pages fall below this level. The MESSAGE UP and DOWN keys move within a group of headers, sub-headers, setting values, or actual values. Continually pressing the MESSAGE RIGHT key from a header display displays specific information for the header category. Conversely, continually pressing the MESSAGE LEFT key from a setting value or actual value display returns to the header display.

HIGHEST LEVEL   **LOWEST LEVEL (SETTING VALUE)**

```
■■ SETTINGS              ◄►    ■ PASSWORD        ◄►    ACCESS LEVEL:
■■ PRODUCT SETUP                ■ SECURITY              Restricted
```

```
                    ▲▼

■■ SETTINGS
■■ SYSTEM SETUP
```

c) EXAMPLE MENU NAVIGATION

```
■■ ACTUAL VALUES
■■ STATUS
```
Press the MENU key until the header for the first Actual Values page appears. This page contains system and relay status information. Repeatedly press the MESSAGE keys to display the other actual value headers.

⇩

```
■■ SETTINGS
■■ PRODUCT SETUP
```
Press the MENU key until the header for the first page of Settings appears. This page contains settings to configure the relay.

⇩

```
■■ SETTINGS
■■ SYSTEM SETUP
```
Press the MESSAGE DOWN key to move to the next Settings page. This page contains settings for System Setup. Repeatedly press the MESSAGE UP and DOWN keys to display the other setting headers and then back to the first Settings page header.

⇩

```
■ PASSWORD
■ SECURITY
```
From the Settings page one header (Product Setup), press the MESSAGE RIGHT key once to display the first sub-header (Password Security).

⇩

```
ACCESS LEVEL:
Restricted
```
Press the MESSAGE RIGHT key once more and this will display the first setting for Password Security. Pressing the MESSAGE DOWN key repeatedly will display the remaining setting messages for this sub-header.

⇩

```
■ PASSWORD
■ SECURITY
```
Press the MESSAGE LEFT key once to move back to the first sub-header message.

⇩

```
■ DISPLAY
■ PROPERTIES
```
Pressing the MESSAGE DOWN key will display the second setting sub-header associated with the Product Setup header.

⇩

```
FLASH MESSAGE
TIME: 1.0 s
```
Press the MESSAGE RIGHT key once more and this will display the first setting for Display Properties.

⇩

```
DEFAULT MESSAGE
INTENSITY: 25%
```
To view the remaining settings associated with the Display Properties subheader, repeatedly press the MESSAGE DOWN key. The last message appears as shown.

a) ENTERING NUMERICAL DATA

Each numerical setting has its own minimum, maximum, and increment value associated with it. These parameters define what values are acceptable for a setting.

```
FLASH MESSAGE
TIME:  1.0 s
```
⇩
```
MINIMUM:   0.5
MAXIMUM:  10.0
```

For example, select the **SETTINGS** ⇨ **PRODUCT SETUP** ⇨⇩ **DISPLAY PROPERTIES** ⇨ **FLASH MESSAGE TIME** setting.

Press the HELP key to view the minimum and maximum values. Press the HELP key again to view the next context sensitive help message.

Two methods of editing and storing a numerical setting value are available.

• **0 to 9 and decimal point**: The relay numeric keypad works the same as that of any electronic calculator. A number is entered one digit at a time. The leftmost digit is entered first and the rightmost digit is entered last. Pressing the MESSAGE LEFT key or pressing the ESCAPE key, returns the original value to the display.

• **VALUE keys**: The VALUE UP key increments the displayed value by the step value, up to the maximum value allowed. While at the maximum value, pressing the VALUE UP key again will allow the setting selection to continue upward from the minimum value. The VALUE DOWN key decrements the displayed value by the step value, down to the minimum value. While at the minimum value, pressing the VALUE DOWN key again will allow the setting selection to continue downward from the maximum value.

```
FLASH MESSAGE
TIME:  2.5 s
```
⇩
```
NEW SETTING
HAS BEEN STORED
```

As an example, set the flash message time setting to 2.5 seconds. Press the appropriate numeric keys in the sequence "2 . 5". The display message will change as the digits are being entered.

Until ENTER is pressed, editing changes are not registered by the relay. Therefore, press ENTER to store the new value in memory. This flash message will momentarily appear as confirmation of the storing process. Numerical values which contain decimal places will be rounded-off if more decimal place digits are entered than specified by the step value.

b) ENTERING ENUMERATION DATA

Enumeration settings have data values which are part of a set, whose members are explicitly defined by a name. A set is comprised of two or more members.

```
ACCESS LEVEL:
Restricted
```

For example, the selections available for **ACCESS LEVEL** are "Restricted", "Command", "Setting", and "Factory Service".

Enumeration type values are changed using the VALUE keys. The VALUE UP key displays the next selection while the VALUE DOWN key displays the previous selection.

```
ACCESS LEVEL:
Setting
```
⇩
```
NEW SETTING
HAS BEEN STORED
```

If the **ACCESS LEVEL** needs to be "Setting", press the VALUE keys until the proper selection is displayed. Press HELP at any time for the context sensitive help messages.

Changes are not registered by the relay until the ENTER key is pressed. Pressing ENTER stores the new value in memory. This flash message momentarily appears as confirmation of the storing process.

c) ENTERING ALPHANUMERIC TEXT

Text settings have data values which are fixed in length, but user-defined in character. They may be comprised of upper case letters, lower case letters, numerals, and a selection of special characters.

There are several places where text messages may be programmed to allow the relay to be customized for specific applications. One example is the Message Scratchpad. Use the following procedure to enter alphanumeric text messages.

For example: to enter the text, "Breaker #1".

1.   Press the decimal to enter text edit mode.

2.   Press the VALUE keys until the character 'B' appears; press the decimal key to advance the cursor to the next position.

3.   Repeat step 2 for the remaining characters: r,e,a,k,e,r, ,#,1.

4.   Press ENTER to store the text.

5.   If you have any problem, press HELP to view context sensitive help. Flash messages will sequentially appear for several seconds each. For the case of a text setting message, pressing HELP displays how to edit and store new values.

d) ACTIVATING THE RELAY

```
RELAY SETTINGS:
Not Programmed
```
When the relay is powered up, the Trouble LED will be on, the In Service LED off, and this message displayed, indicating the relay is in the "Not Programmed" state and is safeguarding (output relays blocked) against the installation of a relay whose settings have not been entered. This message remains until the relay is explicitly put in the "Programmed" state.

To change the **RELAY SETTINGS**: "Not Programmed" mode to "Programmed", proceed as follows:

1.   Press the MENU key until the **SETTINGS** header flashes momentarily and the **PRODUCT SETUP** message appears on the display.

2.   Press the MESSAGE RIGHT key until the **PASSWORD SECURITY** message appears on the display.

3.   Press the MESSAGE DOWN key until the **INSTALLATION** message appears on the display.

4.   Press the MESSAGE RIGHT key until the **RELAY SETTINGS: Not Programmed** message is displayed.
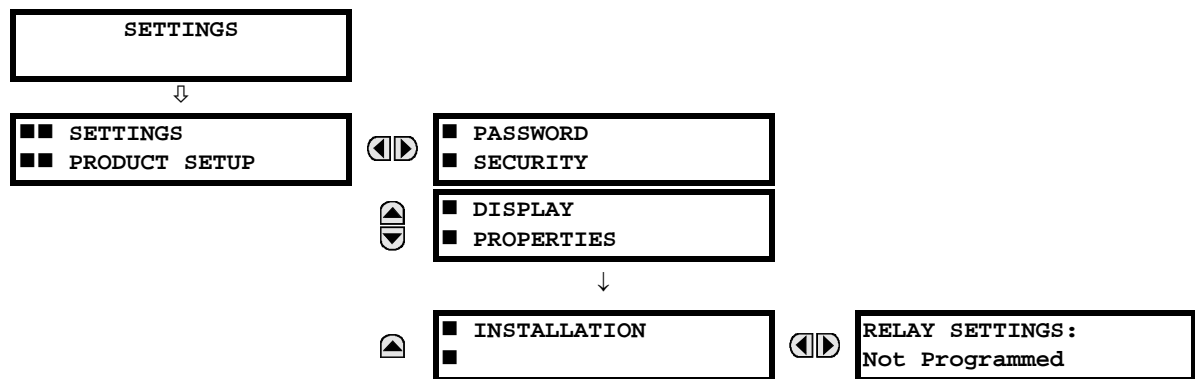

5.   After the **RELAY SETTINGS: Not Programmed** message appears on the display, press the VALUE keys change the selection to "Programmed".

6.   Press the ENTER key.

```
RELAY SETTINGS:        RELAY SETTINGS:        NEW SETTING
Not Programmed         Programmed             HAS BEEN STORED
```

7.   When the "NEW SETTING HAS BEEN STORED" message appears, the relay will be in "Programmed" state and the In Service LED will turn on.

e) ENTERING INITIAL PASSWORDS

The C60 supports password entry from a local or remote connection.

Local access is defined as any access to settings or commands via the faceplate interface. This includes both keypad entry and the faceplate RS232 connection. Remote access is defined as any access to settings or commands via any rear communications port. This includes both Ethernet and RS485 connections. Any changes to the local or remote passwords enables this functionality.

To enter the initial setting (or command) password, proceed as follows:

1. Press the MENU key until the **SETTINGS** header flashes momentarily and the **PRODUCT SETUP** message appears on the display.

2. Press the MESSAGE RIGHT key until the **ACCESS LEVEL** message appears on the display.

3. Press the MESSAGE DOWN key until the **CHANGE LOCAL PASSWORDS** message appears on the display.

4. Press the MESSAGE RIGHT key until the **CHANGE SETTING PASSWORD** or **CHANGE COMMAND PASSWORD** message appears on the display.

```
■■  PASSWORD              ACCESS LEVEL:
■■  SECURITY              Restricted

                          ■  CHANGE LOCAL          CHANGE COMMAND
                          ■  PASSWORDS             PASSWORD: No

                                                   CHANGE SETTING
                                                   PASSWORD: No

                                                   ENCRYPTED COMMAND
                                                   PASSWORD: ---------

                                                   ENCRYPTED SETTING
                                                   PASSWORD: ---------
```
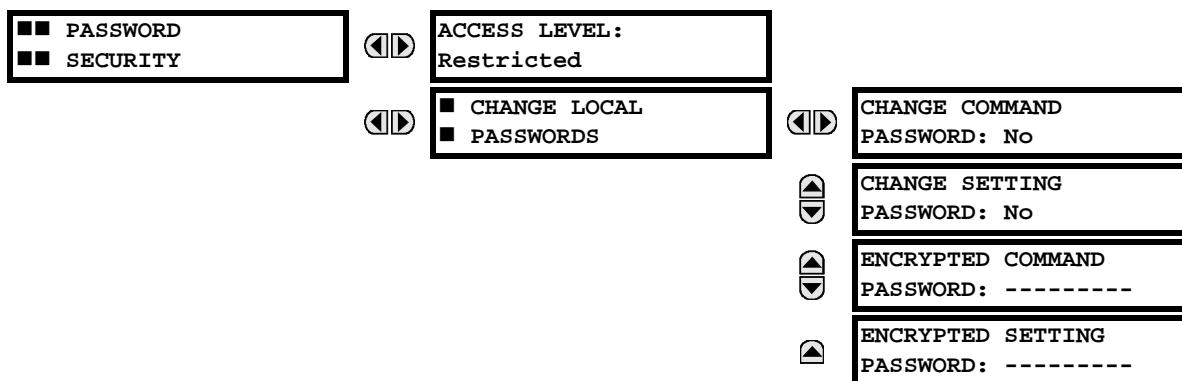

5. After the **CHANGE...PASSWORD** message appears on the display, press the VALUE UP or DOWN key to change the selection to "Yes".

6. Press the ENTER key and the display will prompt you to **ENTER NEW PASSWORD**.

7. Type in a numerical password (up to 10 characters) and press the ENTER key.

8. When the **VERIFY NEW PASSWORD** is displayed, re-type in the same password and press ENTER.

```
CHANGE SETTING
PASSWORD: No

CHANGE SETTING          ENTER NEW               VERIFY NEW
PASSWORD: Yes           PASSWORD: #########     PASSWORD: #########

                                                NEW PASSWORD
                                                HAS BEEN STORED
```

9. When the **NEW PASSWORD HAS BEEN STORED** message appears, your new Setting (or Command) Password will be active.

f) CHANGING EXISTING PASSWORD

To change an existing password, follow the instructions in the previous section with the following exception. A message will prompt you to type in the existing password (for each security level) before a new password can be entered.

In the event that a password has been lost (forgotten), submit the corresponding encrypted password from the **PASSWORD SECURITY** menu to the Factory for decoding.

g) INVALID PASSWORD ENTRY

In the event that an incorrect Command or Setting password has been entered via the faceplate interface three times within a three-minute time span, the LOCAL ACCESS DENIED FlexLogic™ operand will be set to "On" and the C60 will not allow Settings or Command access via the faceplate interface for the next ten minutes. The **TOO MANY ATTEMPTS – BLOCKED**

FOR 10 MIN! flash message will appear upon activation of the ten minute timeout or any other time a user attempts any change to the defined tier during the ten minute timeout. The LOCAL ACCESS DENIED FlexLogic™ operand will be set to "Off" after the expiration of the ten-minute timeout.

In the event that an incorrect Command or Setting password has been entered via the any external communications inter-face three times within a three-minute time span, the REMOTE ACCESS DENIED FlexLogic™ operand will be set to "On" and the C60 will not allow Settings or Command access via the any external communications interface for the next ten minutes. The REMOTE ACCESS DENIED FlexLogic™ operand will be set to "Off" after the expiration of the ten-minute timeout.

5

In the design of UR relays, the term *element* is used to describe a feature that is based around a comparator. The comparator is provided with an input (or set of inputs) that is tested against a programmed setting (or group of settings) to determine if the input is within the defined range that will set the output to logic 1, also referred to as "setting the flag". A single comparator may make multiple tests and provide multiple outputs; for example, the time overcurrent comparator sets a pickup flag when the current input is above the setting and sets an operate flag when the input current has been at a level above the pickup setting for the time specified by the time-current curve settings. All comparators use analog parameter actual values as the input.

> **NOTE**
> The exception to the above rule are the digital elements, which use logic states as inputs.

Elements are arranged into two classes, *grouped* and *control*. Each element classed as a grouped element is provided with six alternate sets of settings, in setting groups numbered 1 through 6. The performance of a grouped element is defined by the setting group that is active at a given time. The performance of a control element is independent of the selected active setting group.

The main characteristics of an element are shown on the element logic diagram. This includes the inputs, settings, fixed logic, and the output operands generated (abbreviations used on scheme logic diagrams are defined in Appendix F).

Some settings for current and voltage elements are specified in per-unit (pu) calculated quantities:

pu quantity = (actual quantity) / (base quantity)

For current elements, the 'base quantity' is the nominal secondary or primary current of the CT.

Where the current source is the sum of two CTs with different ratios, the 'base quantity' will be the common secondary or primary current to which the sum is scaled (that is, normalized to the larger of the two rated CT inputs). For example, if CT1 = 300 / 5 A and CT2 = 100 / 5 A, then in order to sum these, CT2 is scaled to the CT1 ratio. In this case, the base quantity will be 5 A secondary or 300 A primary.

For voltage elements the 'base quantity' is the nominal primary voltage of the protected system which corresponds (based on VT ratio and connection) to secondary VT voltage applied to the relay.

For example, on a system with a 13.8 kV nominal primary voltage and with 14400:120 V delta-connected VTs, the secondary nominal voltage (1 pu) would be:

$$\frac{13800}{14400} \times 120 = 115 \text{ V} \qquad \textbf{(EQ 5.1)}$$

For Wye-connected VTs, the secondary nominal voltage (1 pu) would be:

$$\frac{13800}{14400} \times \frac{120}{\sqrt{3}} = 66.4 \text{ V} \qquad \textbf{(EQ 5.2)}$$

Many settings are common to most elements and are discussed below:

- **FUNCTION setting:** This setting programs the element to be operational when selected as "Enabled". The factory default is "Disabled". Once programmed to "Enabled", any element associated with the function becomes active and all options become available.

- **NAME setting:** This setting is used to uniquely identify the element.

- **SOURCE setting:** This setting is used to select the parameter or set of parameters to be monitored.

- **PICKUP setting:** For simple elements, this setting is used to program the level of the measured parameter above or below which the pickup state is established. In more complex elements, a set of settings may be provided to define the range of the measured parameters which will cause the element to pickup.

- **PICKUP DELAY setting:** This setting sets a time-delay-on-pickup, or on-delay, for the duration between the pickup and operate output states.

- **RESET DELAY setting:** This setting is used to set a time-delay-on-dropout, or off-delay, for the duration between the Operate output state and the return to logic 0 after the input transits outside the defined pickup range.

- **BLOCK setting:** The default output operand state of all comparators is a logic 0 or "flag not set". The comparator remains in this default state until a logic 1 is asserted at the RUN input, allowing the test to be performed. If the RUN input changes to logic 0 at any time, the comparator returns to the default state. The RUN input is used to supervise the comparator. The BLOCK input is used as one of the inputs to RUN control.

- **TARGET setting:** This setting is used to define the operation of an element target message. When set to Disabled, no target message or illumination of a faceplate LED indicator is issued upon operation of the element. When set to Self-Reset, the target message and LED indication follow the Operate state of the element, and self-resets once the operate element condition clears. When set to Latched, the target message and LED indication will remain visible after the element output returns to logic 0 - until a RESET command is received by the relay.

- **EVENTS setting:** This setting is used to control whether the Pickup, Dropout or Operate states are recorded by the event recorder. When set to Disabled, element pickup, dropout or operate are not recorded as events. When set to Enabled, events are created for:

  (Element) PKP (pickup)
  (Element) DPO (dropout)
  (Element) OP (operate)

  The DPO event is created when the measure and decide comparator output transits from the pickup state (logic 1) to the dropout state (logic 0). This could happen when the element is in the operate state if the reset delay time is not '0'.

5.1.3 INTRODUCTION TO AC SOURCES

a) BACKGROUND

The C60 may be used on systems with breaker-and-a-half or ring bus configurations. In these applications, each of the two three-phase sets of individual phase currents (one associated with each breaker) can be used as an input to a breaker failure element. The sum of both breaker phase currents and 3I_0 residual currents may be required for the circuit relaying and metering functions. For a three-winding transformer application, it may be required to calculate watts and vars for each of three windings, using voltage from different sets of VTs. These requirements can be satisfied with a single UR, equipped with sufficient CT and VT input channels, by selecting the parameter to measure. A mechanism is provided to specify the AC parameter (or group of parameters) used as the input to protection/control comparators and some metering elements.

Selection of the parameter(s) to measure is partially performed by the design of a measuring element or protection/control comparator by identifying the type of parameter (fundamental frequency phasor, harmonic phasor, symmetrical component, total waveform RMS magnitude, phase-phase or phase-ground voltage, etc.) to measure. The user completes the process by selecting the instrument transformer input channels to use and some of the parameters calculated from these channels. The input parameters available include the summation of currents from multiple input channels. For the summed currents of phase, 3I_0, and ground current, current from CTs with different ratios are adjusted to a single ratio before summation.

A mechanism called a "Source" configures the routing of CT and VT input channels to measurement sub-systems. Sources, in the context of UR series relays, refer to the logical grouping of current and voltage signals such that one source contains all the signals required to measure the load or fault in a particular power apparatus. A given source may contain all or some of the following signals: three-phase currents, single-phase ground current, three-phase voltages and an auxiliary voltage from a single VT for checking for synchronism.

To illustrate the concept of Sources, as applied to current inputs only, consider the breaker-and-a-half scheme below. In this application, the current flows as shown by the arrows. Some current flows through the upper bus bar to some other location or power equipment, and some current flows into transformer Winding 1. The current into Winding 1 is the phasor sum (or difference) of the currents in CT1 and CT2 (whether the sum or difference is used depends on the relative polarity of the CT connections). The same considerations apply to transformer Winding 2. The protection elements require access to the net current for transformer protection, but some elements may need access to the individual currents from CT1 and CT2.
Figure 5–1: BREAKER-AND-A-HALF SCHEME

In conventional analog or electronic relays, the sum of the currents is obtained from an appropriate external connection of all CTs through which any portion of the current for the element being protected could flow. Auxiliary CTs are required to perform ratio matching if the ratios of the primary CTs to be summed are not identical. In the UR series of relays, provisions have been included for all the current signals to be brought to the UR device where grouping, ratio correction and summation are applied internally via configuration settings.

A major advantage of using internal summation is that the individual currents are available to the protection device; for example, as additional information to calculate a restraint current, or to allow the provision of additional protection features that operate on the individual currents such as breaker failure.

Given the flexibility of this approach, it becomes necessary to add configuration settings to the platform to allow the user to select which sets of CT inputs will be added to form the net current into the protected device.

The internal grouping of current and voltage signals forms an internal source. This source can be given a specific name through the settings, and becomes available to protection and metering elements in the UR platform. Individual names can be given to each source to help identify them more clearly for later use. For example, in the scheme shown in the above diagram, the configures one Source to be the sum of CT1 and CT2 and can name this Source as "Wdg 1 Current".

Once the sources have been configured, the user has them available as selections for the choice of input signal for the protection elements and as metered quantities.

b) CT/VT MODULE CONFIGURATION

CT and VT input channels are contained in CT/VT modules. The type of input channel can be phase/neutral/other voltage, phase/ground current, or sensitive ground current. The CT/VT modules calculate total waveform RMS levels, fundamental frequency phasors, symmetrical components and harmonics for voltage or current, as allowed by the hardware in each channel. These modules may calculate other parameters as directed by the CPU module.

A CT/VT module contains up to eight input channels, numbered 1 through 8. The channel numbering corresponds to the module terminal numbering 1 through 8 and is arranged as follows: Channels 1, 2, 3 and 4 are always provided as a group, hereafter called a "bank," and all four are either current or voltage, as are channels 5, 6, 7 and 8. Channels 1, 2, 3 and 5, 6, 7 are arranged as phase A, B and C respectively. Channels 4 and 8 are either another current or voltage.

Banks are ordered sequentially from the block of lower-numbered channels to the block of higher-numbered channels, and from the CT/VT module with the lowest slot position letter to the module with the highest slot position letter, as follows:

INCREASING SLOT POSITION LETTER -->		
CT/VT MODULE 1	**CT/VT MODULE 2**	**CT/VT MODULE 3**
< bank 1 >	< bank 3 >	< bank 5 >
< bank 2 >	< bank 4 >	< bank 6 >

The UR platform allows for a maximum of three sets of three-phase voltages and six sets of three-phase currents. The result of these restrictions leads to the maximum number of CT/VT modules in a chassis to three. The maximum number of sources is six. A summary of CT/VT module configurations is shown below.

ITEM	MAXIMUM NUMBER
CT/VT Module	2
CT Bank (3 phase channels, 1 ground channel)	8
VT Bank (3 phase channels, 1 auxiliary channel)	4

c) CT/VT INPUT CHANNEL CONFIGURATION

Upon relay startup, configuration settings for every bank of current or voltage input channels in the relay are automatically generated from the order code. Within each bank, a channel identification label is automatically assigned to each bank of channels in a given product. The 'bank' naming convention is based on the physical location of the channels, required by the user to know how to connect the relay to external circuits. Bank identification consists of the letter designation of the slot in which the CT/VT module is mounted as the first character, followed by numbers indicating the channel, either 1 or 5.

For three-phase channel sets, the number of the lowest numbered channel identifies the set. For example, F1 represents the three-phase channel set of F1/F2/F3, where F is the slot letter and 1 is the first channel of the set of three channels.

Upon startup, the CPU configures the settings required to characterize the current and voltage inputs, and will display them in the appropriate section in the sequence of the banks (as described above) as follows for a maximum configuration: F1, F5, M1, M5, U1, and U5.

The above section explains how the input channels are identified and configured to the specific application instrument transformers and the connections of these transformers. The specific parameters to be used by each measuring element and comparator, and some actual values are controlled by selecting a specific source. The source is a group of current and voltage input channels selected by the user to facilitate this selection. With this mechanism, a user does not have to make multiple selections of voltage and current for those elements that need both parameters, such as a distance element or a watt calculation. It also gathers associated parameters for display purposes.

The basic idea of arranging a source is to select a point on the power system where information is of interest. An application example of the grouping of parameters in a source is a transformer winding, on which a three phase voltage is measured, and the sum of the currents from CTs on each of two breakers is required to measure the winding current flow.

5

a) MAIN MENU

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ SECURITY

■ SECURITY ■	◀▮▶	ACCESS LEVEL: Restricted	*Range:* *Restricted, Command, Setting, Factory Service (for factory use only)*
MESSAGE	⬆⬇	■ CHANGE LOCAL ■ PASSWORDS	**See page 5-9.**
MESSAGE	⬆⬇	■ ACCESS ■ SUPERVISION	**See page 5-10.**
MESSAGE	⬆	PASSWORD ACCESS EVENTS: Disabled	*Range:* *Disabled, Enabled*

Two levels of password security are provided via the **ACCESS LEVEL** setting: command and setting. The factory service level is not available and intended for factory use only.

The following operations are under command password supervision:

• Operating the breakers via faceplate keypad.

• Changing the state of virtual inputs.

• Clearing the event records.

• Clearing the oscillography records.

• Clearing fault reports.

• Changing the date and time.

• Clearing the breaker arcing current.

• Clearing energy records.

• Clearing the data logger.

• Clearing the user-programmable pushbutton states.

The following operations are under setting password supervision:

• Changing any setting.

• Test mode operation.

The command and setting passwords are defaulted to "0" when the relay is shipped from the factory. When a password is set to "0", the password security feature is disabled.

The C60 supports password entry from a local or remote connection.

Local access is defined as any access to settings or commands via the faceplate interface. This includes both keypad entry and the through the faceplate RS232 port. Remote access is defined as any access to settings or commands via any rear communications port. This includes both Ethernet and RS485 connections. Any changes to the local or remote passwords enables this functionality.

When entering a settings or command password via EnerVista or any serial interface, the user must enter the corresponding connection password. If the connection is to the back of the C60, the remote password must be used. If the connection is to the RS232 port of the faceplate, the local password must be used.

The **PASSWORD ACCESS EVENTS** settings allows recording of password access events in the event recorder.

b) LOCAL PASSWORDS

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ SECURITY ⇨⇩ CHANGE LOCAL PASSWORDS

■ CHANGE LOCAL ■ PASSWORDS	◀▶ CHANGE COMMAND PASSWORD: No	*Range:* *No, Yes*
MESSAGE ⬆⬇	CHANGE SETTING PASSWORD: No	*Range:* *No, Yes*
MESSAGE ⬆⬇	ENCRYPTED COMMAND PASSWORD: ----------	*Range:* *0 to 9999999999* *Note: ---------- indicates no password*
MESSAGE ⬆	ENCRYPTED SETTING PASSWORD: ----------	*Range:* *0 to 9999999999* *Note: ---------- indicates no password*

Proper password codes are required to enable each access level. A password consists of 1 to 10 numerical characters. When a **CHANGE COMMAND PASSWORD** or **CHANGE SETTING PASSWORD** setting is programmed to "Yes" via the front panel interface, the following message sequence is invoked:

1. ENTER NEW PASSWORD: _____.

2. VERIFY NEW PASSWORD: _____.

3. NEW PASSWORD HAS BEEN STORED.

To gain write access to a "Restricted" setting, program the **ACCESS LEVEL** setting in the main security menu to "Setting" and then change the setting, or attempt to change the setting and follow the prompt to enter the programmed password. If the password is correctly entered, access will be allowed. Accessibility automatically reverts to the "Restricted" level according to the access level timeout setting values.

If an entered password is lost (or forgotten), consult the factory with the corresponding **ENCRYPTED PASSWORD**.

> **NOTE**
> **If the setting and command passwords are identical, then this one password allows access to both commands and settings.**

c) REMOTE PASSWORDS

The remote password settings are only visible from a remote connection via the EnerVista UR Setup software. Select the **Settings > Product Setup > Password Security** menu item to open the remote password settings window.

PARAMETER	ENCRYPTED PASSWORD	ENTER NEW PASSWORD	CONFIRM NEW PASSWORD	CHANGE PASSWORD
Command Password	0			Change
Setting Password	0			Change

UR IED 3 | Settings: Product Setup   Screen ID: 248

Figure 5–2: REMOTE PASSWORD SETTINGS WINDOW

Proper passwords are required to enable each command or setting level access. A command or setting password consists of 1 to 10 numerical characters and are initially programmed to "0". The following procedure describes how the set the command or setting password.

1. Enter the new password in the **Enter New Password** field.

2. Re-enter the password in the **Confirm New Password** field.

3. Click the **Change** button. This button will not be active until the new password matches the confirmation password.

4. If the original password is not "0", then enter the original password in the **Enter Password** field and click the **Send Password to Device** button.

Enter Password For COMMANDS	
Encripted password:	1709472037
Status:	Disabled
Enter Password:	****
	Send Password To Device
	OK Cancel

5. The new password is accepted and a value is assigned to the **ENCRYPTED PASSWORD** item.

Password Security // Site 1: UR IED 3: Settings: Product Setup

| | Save | Restore | Default | Reset | VIEW ALL mode |

PARAMETER	ENCRYPTED PASSWORD	ENTER NEW PASSWORD	CONFIRM NEW PASSWORD	CHANGE PASSWORD
Command Password	796162341			Change
Setting Password	0			Change

UR IED 3 | Settings: Product Setup | Screen ID: 248

If a command or setting password is lost (or forgotten), consult the factory with the corresponding **Encrypted Password** value.

d) ACCESS SUPERVISION

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ SECURITY ⇨ ⇩ ACCESS SUPERVISION

```
■ ACCESS                 ◄▶     ■ ACCESS LEVEL
■ SUPERVISION                   ■ TIMEOUTS

                          ▲     INVALID ATTEMPTS          Range:  2 to 5 in steps of 1
           MESSAGE        ▼     BEFORE LOCKOUT: 3

                          ▲     PASSWORD LOCKOUT          Range:  5 to 60 minutes in steps of 1
           MESSAGE              DURATION: 5 min
```

The following access supervision settings are available.

- **INVALID ATTEMPTS BEFORE LOCKOUT**: This setting specifies the number of times an incorrect password can be entered within a three-minute time span before lockout occurs. When lockout occurs, the LOCAL ACCESS DENIED and REMOTE ACCESS DENIED FlexLogic™ operands are set to "On". These operands are returned to the "Off" state upon expiration of the lockout.

- **PASSWORD LOCKOUT DURATION**: This setting specifies the time that the C60 will lockout password access after the number of invalid password entries specified by the **INVALID ATTEMPS BEFORE LOCKOUT** setting has occurred.

The C60 provides a means to raise an alarm upon failed password entry. Should password verification fail while accessing a password-protected level of the relay (either settings or commands), the UNAUTHORIZED ACCESS FlexLogic™ operand is asserted. The operand can be programmed to raise an alarm via contact outputs or communications. This feature can be used to protect against both unauthorized and accidental access attempts.

The UNAUTHORIZED ACCESS operand is reset with the **COMMANDS ⇨⇩ CLEAR RECORDS ⇨⇩ RESET UNAUTHORIZED ALARMS** command. Therefore, to apply this feature with security, the command level should be password-protected. The operand does not generate events or targets.

If events or targets are required, the UNAUTHORIZED ACCESS operand can be assigned to a digital element programmed with event logs or targets enabled.

The access level timeout settings are shown below.

```
■ ACCESS LEVEL          ◀▮▶   COMMAND LEVEL ACCESS      Range:  5 to 480 minutes in steps of 1
■ TIMEOUTS                    TIMEOUT: 5 min

           MESSAGE    ▲       SETTING LEVEL ACCESS      Range:  5 to 480 minutes in steps of 1
                              TIMEOUT: 30 min
```

These settings allow the user to specify the length of inactivity required before returning to the restricted access level. Note that the access level will set as restricted if control power is cycled.

- **COMMAND LEVEL ACCESS TIMEOUT**: This setting specifies the length of inactivity (no local or remote access) required to return to restricted access from the command password level.

- **SETTING LEVEL ACCESS TIMEOUT**: This setting specifies the length of inactivity (no local or remote access) required to return to restricted access from the command password level.

5.2.2 DISPLAY PROPERTIES

```
■ DISPLAY           ◀▮▶   LANGUAGE:              Range:  English; English, French; English, Russian;
■ PROPERTIES              English                        English, Chinese
                                                         (range dependent on order code)

         MESSAGE  ▲▼     FLASH MESSAGE          Range:  0.5 to 10.0 s in steps of 0.1
                         TIME:   1.0 s

         MESSAGE  ▲▼     DEFAULT MESSAGE        Range:  10 to 900 s in steps of 1
                         TIMEOUT: 300 s

         MESSAGE  ▲▼     DEFAULT MESSAGE        Range:  25%, 50%, 75%, 100%
                         INTENSITY: 25 %                Visible only if a VFD is installed

         MESSAGE  ▲▼     SCREEN SAVER           Range:  Disabled, Enabled
                         FEATURE: Disabled              Visible only if an LCD is installed

         MESSAGE  ▲▼     SCREEN SAVER WAIT      Range:  1 to 65535 min. in steps of 1
                         TIME: 30 min                   Visible only if an LCD is installed

         MESSAGE  ▲▼     CURRENT CUT-OFF        Range:  0.002 to 0.020 pu in steps of 0.001
                         LEVEL: 0.020 pu

         MESSAGE  ▲       VOLTAGE CUT-OFF        Range:  0.1 to 1.0 V secondary in steps of 0.1
                         LEVEL: 1.0 V
```

Some relay messaging characteristics can be modified to suit different situations using the display properties settings.

- **LANGUAGE**: This setting selects the language used to display settings, actual values, and targets. The range is dependent on the order code of the relay.

- **FLASH MESSAGE TIME**: Flash messages are status, warning, error, or information messages displayed for several seconds in response to certain key presses during setting programming. These messages override any normal messages. The duration of a flash message on the display can be changed to accommodate different reading rates.

- **DEFAULT MESSAGE TIMEOUT**: If the keypad is inactive for a period of time, the relay automatically reverts to a default message. The inactivity time is modified via this setting to ensure messages remain on the screen long enough during programming or reading of actual values.

- **DEFAULT MESSAGE INTENSITY**: To extend phosphor life in the vacuum fluorescent display, the brightness can be attenuated during default message display. During keypad interrogation, the display always operates at full brightness.

- **SCREEN SAVER FEATURE** and **SCREEN SAVER WAIT TIME**: These settings are only visible if the C60 has a liquid crystal display (LCD) and control its backlighting. When the **SCREEN SAVER FEATURE** is "Enabled", the LCD backlighting is turned off after the **DEFAULT MESSAGE TIMEOUT** followed by the **SCREEN SAVER WAIT TIME**, providing that no keys have been pressed and no target messages are active. When a keypress occurs or a target becomes active, the LCD backlighting is turned on.

- **CURRENT CUT-OFF LEVEL**: This setting modifies the current cut-off threshold. Very low currents (1 to 2% of the rated value) are very susceptible to noise. Some customers prefer very low currents to display as zero, while others prefer the current be displayed even when the value reflects noise rather than the actual signal. The C60 applies a cut-off value to the magnitudes and angles of the measured currents. If the magnitude is below the cut-off level, it is substituted with zero. This applies to phase and ground current phasors as well as true RMS values and symmetrical components. The cut-off operation applies to quantities used for metering, protection, and control, as well as those used by communications protocols. Note that the cut-off level for the sensitive ground input is 10 times lower that the **CURRENT CUT-OFF LEVEL** setting value. Raw current samples available via oscillography are not subject to cut-off.

- **VOLTAGE CUT-OFF LEVEL**: This setting modifies the voltage cut-off threshold. Very low secondary voltage measurements (at the fractional volt level) can be affected by noise. Some customers prefer these low voltages to be displayed as zero, while others prefer the voltage to be displayed even when the value reflects noise rather than the actual signal. The C60 applies a cut-off value to the magnitudes and angles of the measured voltages. If the magnitude is below the cut-off level, it is substituted with zero. This operation applies to phase and auxiliary voltages, and symmetrical components. The cut-off operation applies to quantities used for metering, protection, and control, as well as those used by communications protocols. Raw samples of the voltages available via oscillography are not subject cut-off.

The **CURRENT CUT-OFF LEVEL** and the **VOLTAGE CUT-OFF LEVEL** are used to determine the metered power cut-off levels. The power cut-off level is calculated as shown below. For Delta connections:

$$\text{3-phase power cut-off} = \frac{\sqrt{3} \times \textbf{CURRENT CUT-OFF LEVEL} \times \textbf{VOLTAGE CUT-OFF LEVEL} \times \text{VT primary} \times \text{CT primary}}{\text{VT secondary}} \quad \textbf{(EQ 5.3)}$$

For Wye connections:

$$\text{3-phase power cut-off} = \frac{3 \times \textbf{CURRENT CUT-OFF LEVEL} \times \textbf{VOLTAGE CUT-OFF LEVEL} \times \text{VT primary} \times \text{CT primary}}{\text{VT secondary}} \quad \textbf{(EQ 5.4)}$$

$$\text{per-phase power cut-off} = \frac{\textbf{CURRENT CUT-OFF LEVEL} \times \textbf{VOLTAGE CUT-OFF LEVEL} \times \text{VT primary} \times \text{CT primary}}{\text{VT secondary}} \quad \textbf{(EQ 5.5)}$$

where VT primary = VT secondary $\times$ VT ratio and CT primary = CT secondary $\times$ CT ratio.

For example, given the following settings:

CURRENT CUT-OFF LEVEL: "0.02 pu"
VOLTAGE CUT-OFF LEVEL: "1.0 V"
PHASE CT PRIMARY: "100 A"
PHASE VT SECONDARY: "66.4 V"
PHASE VT RATIO: "208.00 : 1"
PHASE VT CONNECTION: "Delta".

We have:

CT primary = "100 A", and
VT primary = **PHASE VT SECONDARY** x **PHASE VT RATIO** = 66.4 V x 208 = 13811.2 V

The power cut-off is therefore:

power cut-off = (**CURRENT CUT-OFF LEVEL** $\times$ **VOLTAGE CUT-OFF LEVEL** $\times$ CT primary $\times$ VT primary)/VT secondary
  = ($\sqrt{3}$ $\times$ 0.02 pu $\times$ 1.0 V $\times$ 100 A $\times$ 13811.2 V) / 66.4 V
  = 720.5 watts

Any calculated power value below this cut-off will not be displayed. As well, the three-phase energy data will not accumulate if the total power from all three phases does not exceed the power cut-off.

> **NOTE**
> **Lower the VOLTAGE CUT-OFF LEVEL and CURRENT CUT-OFF LEVEL with care as the relay accepts lower signals as valid measurements. Unless dictated otherwise by a specific application, the default settings of "0.02 pu" for CURRENT CUT-OFF LEVEL and "1.0 V" for VOLTAGE CUT-OFF LEVEL are recommended.**

Range: FlexLogic™ operand

Range: FlexLogic™ operand

Range: FlexLogic™ operand

Range: FlexLogic™ operand.
Valid only for units with Direct I/O module.

Selected records can be cleared from user-programmable conditions with FlexLogic™ operands. Assigning user-programmable pushbuttons to clear specific records are typical applications for these commands. Since the C60 responds to rising edges of the configured FlexLogic™ operands, they must be asserted for at least 50 ms to take effect.

Clearing records with user-programmable operands is not protected by the command password. However, user-programmable pushbuttons are protected by the command password. Thus, if they are used to clear records, the user-programmable pushbuttons can provide extra security if required.

For example, to assign User-Programmable Pushbutton 1 to clear demand records, the following settings should be applied.

1. Assign the clear demand function to Pushbutton 1 by making the following change in the **SETTINGS** ⇨ **PRODUCT SETUP** ⇨⇩ **CLEAR RELAY RECORDS** menu:

    CLEAR DEMAND: "PUSHBUTTON 1 ON"

2. Set the properties for User-Programmable Pushbutton 1 by making the following changes in the **SETTINGS** ⇨ **PRODUCT SETUP** ⇨⇩ **USER-PROGRAMMABLE PUSHBUTTONS** ⇨ **USER PUSHBUTTON 1** menu:

    PUSHBUTTON 1 FUNCTION: "Self-reset"
    PUSHBTN 1 DROP-OUT TIME: "0.20 s"

The C60 is equipped with up to three independent serial communication ports. The faceplate RS232 port is intended for local use and is fixed at 19200 baud and no parity. The rear COM1 port type is selected when ordering: either an Ethernet or RS485 port. The rear COM2 port is RS485. The RS485 ports have settings for baud rate and parity. It is important that

these parameters agree with the settings used on the computer or other equipment that is connected to these ports. Any of these ports may be connected to a computer running EnerVista UR Setup. This software can download and upload setting files, view measured parameters, and upgrade the relay firmware. A maximum of 32 relays can be daisy-chained and connected to a DCS, PLC or PC using the RS485 ports.

> **NOTE** **For each RS485 port, the minimum time before the port will transmit after receiving data from a host can be set. This feature allows operation with hosts which hold the RS485 transmitter active for some time after each transmission.**

c) NETWORK

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ NETWORK

■ NETWORK ■	◄▮►	IP ADDRESS: 0.0.0.0	*Range:*	*Standard IP address format* *Not shown if CPU Type E is ordered.*
	MESSAGE ▲▼	SUBNET IP MASK: 0.0.0.0	*Range:*	*Standard IP address format* *Not shown if CPU Type E is ordered.*
	MESSAGE ▲▼	GATEWAY IP ADDRESS: 0.0.0.0	*Range:*	*Standard IP address format* *Not shown if CPU Type E is ordered.*
	MESSAGE ▲▼	■ OSI NETWORK ■ ADDRESS (NSAP)	*Range:*	*Select to enter the* **OSI NETWORK ADDRESS**. *Not shown if CPU Type E is ordered.*
	MESSAGE ▲	ETHERNET OPERATION MODE: Full-Duplex	*Range:*	*Half-Duplex, Full-Duplex* *Not shown if CPU Type E or N is ordered.*

These messages appear only if the C60 is ordered with an Ethernet card.

The IP addresses are used with the DNP, Modbus/TCP, IEC 61580, IEC 60870-5-104, TFTP, and HTTP protocols. The NSAP address is used with the IEC 61850 protocol over the OSI (CLNP/TP4) stack only. Each network protocol has a setting for the TCP/UDP port number. These settings are used only in advanced network configurations and should normally be left at their default values, but may be changed if required (for example, to allow access to multiple UR-series relays behind a router). By setting a different **TCP/UDP PORT NUMBER** for a given protocol on each UR-series relay, the router can map the relays to the same external IP address. The client software (EnerVista UR Setup, for example) must be configured to use the correct port number if these settings are used.

> **NOTE** When the NSAP address, any TCP/UDP port number, or any user map setting (when used with DNP) is changed, it will not become active until power to the relay has been cycled (off-on).

> **WARNING** **Do not set more than one protocol to the same TCP/UDP PORT NUMBER, as this will result in unreliable operation of those protocols.**

d) MODBUS PROTOCOL

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ MODBUS PROTOCOL

| ■ MODBUS PROTOCOL ■ | ◄▮► | MODBUS SLAVE ADDRESS: 254 | *Range:* | *1 to 254 in steps of 1* |
| | *MESSAGE* ▲ | MODBUS TCP PORT NUMBER: 502 | *Range:* | *1 to 65535 in steps of 1* |

The serial communication ports utilize the Modbus protocol, unless configured for DNP or IEC 60870-5-104 operation (see descriptions below). This allows the EnerVista UR Setup software to be used. The UR operates as a Modbus slave device only. When using Modbus protocol on the RS232 port, the C60 will respond regardless of the **MODBUS SLAVE ADDRESS** programmed. For the RS485 ports each C60 must have a unique address from 1 to 254. Address 0 is the broadcast address which all Modbus slave devices listen to. Addresses do not have to be sequential, but no two devices can have the same address or conflicts resulting in errors will occur. Generally, each device added to the link should use the next higher address starting at 1. Refer to Appendix B for more information on the Modbus protocol.

> **NOTE** **Changes to the MODBUS TCP PORT NUMBER setting will not take effect until the C60 is restarted.**

The C60 supports the Distributed Network Protocol (DNP) version 3.0. The C60 can be used as a DNP slave device connected to multiple DNP masters (usually an RTU or a SCADA master station). Since the C60 maintains two sets of DNP data change buffers and connection information, two DNP masters can actively communicate with the C60 at one time.

> **NOTE**
> **The IEC 60870-5-104 and DNP protocols cannot be simultaneously. When the IEC 60870-5-104 FUNCTION setting is set to "Enabled", the DNP protocol will not be operational. When this setting is changed it will not become active until power to the relay has been cycled (off-to-on).**

The DNP Channels sub-menu is shown below.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ DNP PROTOCOL ⇨ DNP CHANNELS

```
■ DNP CHANNELS
■
```
◀▶
```
DNP CHANNEL 1 PORT:
NETWORK
```
Range: NONE, COM1 - RS485, COM2 - RS485, FRONT PANEL - RS232, NETWORK - TCP, NETWORK - UDP

MESSAGE ⏶
```
DNP CHANNEL 2 PORT:
COM2 - RS485
```
Range: NONE, COM1 - RS485, COM2 - RS485, FRONT PANEL - RS232, NETWORK - TCP, NETWORK - UDP

The **DNP CHANNEL 1 PORT** and **DNP CHANNEL 2 PORT** settings select the communications port assigned to the DNP protocol for each channel. Once DNP is assigned to a serial port, the Modbus protocol is disabled on that port. Note that COM1 can be used only in non-Ethernet UR relays. When this setting is set to "Network - TCP", the DNP protocol can be used over TCP/IP on channels 1 or 2. When this value is set to "Network - UDP", the DNP protocol can be used over UDP/IP on channel 1 only. Refer to *Appendix E* for additional information on the DNP protocol.

> **NOTE**
> **Changes to the DNP CHANNEL 1 PORT and DNP CHANNEL 2 PORT settings will take effect only after power has been cycled to the relay.**

The **DNP NETWORK CLIENT ADDRESS** settings can force the C60 to respond to a maximum of five specific DNP masters. The settings in this sub-menu are shown below.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ DNP PROTOCOL ⇨ DNP NETWORK CLIENT ADDRESSES

```
■ DNP NETWORK                ◀▶    CLIENT ADDRESS 1:        Range:   standard IP address

                                    0.0.0.0
```

The **DNP UNSOL RESPONSE FUNCTION** should be "Disabled" for RS485 applications since there is no collision avoidance mechanism. The **DNP UNSOL RESPONSE TIMEOUT** sets the time the C60 waits for a DNP master to confirm an unsolicited response. The **DNP UNSOL RESPONSE MAX RETRIES** setting determines the number of times the C60 retransmits an unsolicited response without receiving confirmation from the master; a value of "255" allows infinite re-tries. The **DNP UNSOL RESPONSE DEST ADDRESS** is the DNP address to which all unsolicited responses are sent. The IP address to which unsolicited responses are sent is determined by the C60 from the current TCP connection or the most recent UDP message.

The DNP scale factor settings are numbers used to scale analog input point values. These settings group the C60 analog input data into the following types: current, voltage, power, energy, power factor, and other. Each setting represents the scale factor for all analog input points of that type. For example, if the **DNP VOLTAGE SCALE FACTOR** setting is set to "1000", all DNP analog input points that are voltages will be returned with values 1000 times smaller (for example, a value of 72000 V on the C60 will be returned as 72). These settings are useful when analog input values must be adjusted to fit within certain ranges in DNP masters. Note that a scale factor of 0.1 is equivalent to a multiplier of 10 (that is, the value will be 10 times larger).

The **DNP DEFAULT DEADBAND** settings determine when to trigger unsolicited responses containing analog input data. These settings group the C60 analog input data into the following types: current, voltage, power, energy, power factor, and other. Each setting represents the default deadband value for all analog input points of that type. For example, to trigger unsolicited responses from the C60 when any current values change by 15 A, the **DNP CURRENT DEFAULT DEADBAND** setting should be set to "15". Note that these settings are the deadband default values. DNP object 34 points can be used to change deadband values, from the default, for each individual DNP analog input point. Whenever power is removed and re-applied to the C60, the default deadbands will be in effect.

The **DNP TIME SYNC IIN PERIOD** setting determines how often the Need Time Internal Indication (IIN) bit is set by the C60. Changing this time allows the DNP master to send time synchronization commands more or less often, as required.

The **DNP MESSAGE FRAGMENT SIZE** setting determines the size, in bytes, at which message fragmentation occurs. Large fragment sizes allow for more efficient throughput; smaller fragment sizes cause more application layer confirmations to be necessary which can provide for more robust data transfer over noisy communication channels.

> **NOTE**
>
> When the DNP data points (analog inputs and/or binary inputs) are configured for Ethernet-enabled relays, check the "DNP Points Lists" C60 web page to view the points lists. This page can be viewed with a web browser by entering the C60 IP address to access the C60 "Main Menu", then by selecting the "Device Information Menu" > "DNP Points Lists" menu item.

The **DNP OBJECT 1 DEFAULT VARIATION** to **DNP OBJECT 32 DEFAULT VARIATION** settings allow the user to select the DNP default variation number for object types 1, 2, 20, 21, 22, 23, 30, and 32. The default variation refers to the variation response when variation 0 is requested and/or in class 0, 1, 2, or 3 scans. Refer to the *DNP implementation* section in appendix E for additional details.

The DNP binary outputs typically map one-to-one to IED data points. That is, each DNP binary output controls a single physical or virtual control point in an IED. In the C60 relay, DNP binary outputs are mapped to virtual inputs. However, some legacy DNP implementations use a mapping of one DNP binary output to two physical or virtual control points to support the concept of trip/close (for circuit breakers) or raise/lower (for tap changers) using a single control point. That is, the DNP master can operate a single point for both trip and close, or raise and lower, operations. The C60 can be configured to sup-

port paired control points, with each paired control point operating two virtual inputs. The **DNP NUMBER OF PAIRED CONTROL POINTS** setting allows configuration of from 0 to 32 binary output paired controls. Points not configured as paired operate on a one-to-one basis.

The **DNP ADDRESS** setting is the DNP slave address. This number identifies the C60 on a DNP communications link. Each DNP slave should be assigned a unique address.

The **DNP TCP CONNECTION TIMEOUT** setting specifies a time delay for the detection of dead network TCP connections. If there is no data traffic on a DNP TCP connection for greater than the time specified by this setting, the connection will be aborted by the C60. This frees up the connection to be re-used by a client.

> **NOTE**
> Relay power must be re-cycled after changing the **DNP TCP CONNECTION TIMEOUT** setting for the changes to take effect.

f) DNP / IEC 60870-5-104 POINT LISTS

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ DNP / IEC104 POINT LISTS

```
 ■ DNP / IEC104          ◀▮▶    ■ BINARY INPUT / MSP      Range:  see sub-menu below
 ■ POINT LISTS                  ■ POINTS

              MESSAGE   ▲        ■ ANALOG INPUT / MME      Range:  see sub-menu below
                                 ■ POINTS
```

The binary and analog inputs points for the DNP protocol, or the MSP and MME points for IEC 60870-5-104 protocol, can configured to a maximum of 256 points. The value for each point is user-programmable and can be configured by assigning FlexLogic™ operands for binary inputs / MSP points or FlexAnalog parameters for analog inputs / MME points.

The menu for the binary input points (DNP) or MSP points (IEC 60870-5-104) is shown below.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ DNP / IEC104 POINT LISTS ⇨ BINARY INPUT / MSP POINTS

```
 ■ BINARY INPUT / MSP    ◀▮▶    Point:   0               Range:  FlexLogic™ operand
 ■ POINTS                       Off

              MESSAGE   ▲        Point:   1               Range:  FlexLogic™ operand
                                Off
                                      ↓
              MESSAGE   ▲        Point:   255             Range:  FlexLogic™ operand
                                Off
```

Up to 256 binary input points can be configured for the DNP or IEC 60870-5-104 protocols. The points are configured by assigning an appropriate FlexLogic™ operand. Refer to the *Introduction to FlexLogic™* section in this chapter for the full range of assignable operands.

The menu for the analog input points (DNP) or MME points (IEC 60870-5-104) is shown below.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ DNP / IEC104 POINT LISTS ⇨⇩ ANALOG INPUT / MME POINTS

```
 ■ ANALOG INPUT / MME    ◀▮▶    Point:   0               Range:  any FlexAnalog parameter
 ■ POINTS                       Off

              MESSAGE   ▲        Point:   1               Range:  any FlexAnalog parameter
                                Off
                                      ↓
              MESSAGE   ▲        Point:   255             Range:  any FlexAnalog parameter
                                Off
```

Up to 256 analog input points can be configured for the DNP or IEC 60870-5-104 protocols. The analog point list is configured by assigning an appropriate FlexAnalog parameter to each point. Refer to Appendix A: *FlexAnalog Parameters* for the full range of assignable parameters.

> **NOTE**
>
> **The DNP / IEC 60870-5-104 point lists always begin with point 0 and end at the first "Off" value. Since DNP / IEC 60870-5-104 point lists must be in one continuous block, any points assigned after the first "Off" point are ignored.**

> **NOTE**
>
> **Changes to the DNP / IEC 60870-5-104 point lists will not take effect until the C60 is restarted.**

g) IEC 61850 PROTOCOL

> **SOFTWARE OPTION**
>
> The C60 Breaker Protection System is provided with optional IEC 61850 communications capability. This feature is specified as a software option at the time of ordering. Refer to the *Ordering* section of chapter 2 for additional details. The IEC 61850 protocol features are not available if CPU type E is ordered.

The C60 supports the Manufacturing Message Specification (MMS) protocol as specified by IEC 61850. MMS is supported over two protocol stacks: TCP/IP over ethernet and TP4/CLNP (OSI) over ethernet. The C60 operates as an IEC 61850 server. The *Remote inputs and outputs* section in this chapter describe the peer-to-peer GSSE/GOOSE message scheme.

The GSSE/GOOSE configuration main menu is divided into two areas: transmission and reception.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨ GSSE/GOOSE CONFIGURATION

```
■ GSSE / GOOSE           ◀▮▶      ■ TRANSMISSION
■ CONFIGURATION                   ■

                MESSAGE   ▲       ■ RECEPTION
                                  ■
```

The main transmission menu is shown below:

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨ GSSE/GOOSE... ⇨ TRANSMISSION

```
■ TRANSMISSION          ◁▷      ■ GENERAL
■                               ■
```

```
            MESSAGE  ⬆⬇        ■ GSSE
                               ■
```

```
            MESSAGE  ⬆⬇        ■ FIXED GOOSE
                               ■
```

```
            MESSAGE  ⬆         ■ CONFIGURABLE
                               ■ GOOSE
```

The general transmission settings are shown below:

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850... ⇨ GSSE/GOOSE... ⇨ TRANSMISSION ⇨ GENERAL

```
■ GENERAL               ◁▷      DEFAULT GSSE/GOOSE        Range:  1 to 60 s in steps of 1
■                               UPDATE TIME: 60 s
```

The **DEFAULT GSSE/GOOSE UPDATE TIME** sets the time between GSSE or GOOSE messages when there are no remote output state changes to be sent. When remote output data changes, GSSE or GOOSE messages are sent immediately. This setting controls the steady-state *heartbeat* time interval.

The **DEFAULT GSSE/GOOSE UPDATE TIME** setting is applicable to GSSE, fixed C60 GOOSE, and configurable GOOSE.

The GSSE settings are shown below:

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850... ⇨ GSSE/GOOSE... ⇨ TRANSMISSION ⇨⇩ GSEE

```
■ GSSE                  ◁▷      GSSE FUNCTION:           Range:  Enabled, Disabled
■                               Enabled
```

```
            MESSAGE  ⬆⬇        GSSE ID:                 Range:  65-character ASCII string
                               GSSEOut
```

```
            MESSAGE  ⬆         DESTINATION MAC:         Range:  standard MAC address
                               000000000000
```

These settings are applicable to GSSE only. If the fixed GOOSE function is enabled, GSSE messages are not transmitted.

The **GSSE ID** setting represents the IEC 61850 GSSE application ID name string sent as part of each GSSE message. This string identifies the GSSE message to the receiving device. In C60 releases previous to 5.0x, this name string was represented by the **RELAY NAME** setting.

The fixed GOOSE settings are shown below:

PATH: SETTINGS ⇨ PRODUCT... ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850... ⇨ GSSE/GOOSE... ⇨ TRANSMISSION ⇨⇩ FIXED GOOSE

```
■ FIXED GOOSE           ◁▷      GOOSE FUNCTION:          Range:  Enabled, Disabled
■                               Disabled
```

```
            MESSAGE  ⬆⬇        GOOSE ID:                Range:  65-character ASCII string
                               GOOSEOut
```

```
            MESSAGE  ⬆⬇        DESTINATION MAC:         Range:  standard MAC address
                               000000000000
```

```
            MESSAGE  ⬆⬇        GOOSE VLAN PRIORITY:     Range:  0 to 7 in steps of 1
                               4
```

```
            MESSAGE  ⬆⬇        GOOSE VLAN ID:           Range:  0 to 4095 in steps of 1
                                  0
```

```
            MESSAGE  ⬆         GOOSE ETYPE APPID:       Range:  0 to 16383 in steps of 1
                                  0
```

These settings are applicable to fixed (DNA/UserSt) GOOSE only.

The **GOOSE ID** setting represents the IEC 61850 GOOSE application ID (GoID) name string sent as part of each GOOSE message. This string identifies the GOOSE message to the receiving device. In revisions previous to 5.0x, this name string was represented by the **RELAY NAME** setting.

The **DESTINATION MAC** setting allows the destination Ethernet MAC address to be set. This address must be a multicast address; the least significant bit of the first byte must be set. In C60 releases previous to 5.0x, the destination Ethernet MAC address was determined automatically by taking the sending MAC address (that is, the unique, local MAC address of the C60) and setting the multicast bit.

The **GOOSE VLAN PRIORITY** setting indicates the Ethernet priority of GOOSE messages. This allows GOOSE messages to have higher priority than other Ethernet data. The **GOOSE ETYPE APPID** setting allows the selection of a specific application ID for each GOOSE sending device. This value can be left at its default if the feature is not required. Both the **GOOSE VLAN PRIORITY** and **GOOSE ETYPE APPID** settings are required by IEC 61850.

The configurable GOOSE settings are shown below.

PATH: SETTINGS... ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850... ⇨ GSSE... ⇨ TRANSMISSION ⇨⇩ CONFIGURABLE GOOSE 1(8)

■ CONFIGURABLE ■ GOOSE 1	◀▶	CONFIG GSE 1 FUNCTION: Enabled	Range: Enabled, Disabled

MESSAGE	⬆	■ CONFIG GSE 1 ■ DATASET ITEMS	Range: 64 data items; each can be set to all valid MMS data item references for transmitted data

The configurable GOOSE settings allow the C60 to be configured to transmit a number of different datasets within IEC 61850 GOOSE messages. Up to eight different configurable datasets can be configured and transmitted. This is useful for intercommunication between C60 IEDs and devices from other manufacturers that support IEC 61850.

The configurable GOOSE feature allows for the configuration of the datasets to be transmitted or received from the C60. The C60 supports the configuration of eight (8) transmission and reception datasets, allowing for the optimization of data transfer between devices.

Items programmed for dataset 1 will have changes in their status transmitted as soon as the change is detected. Dataset 1 should be used for high-speed transmission of data that is required for applications such as transfer tripping, blocking, and breaker fail initiate. At least one digital status value needs to be configured in dataset 1 to enable transmission of all data configured for dataset 1. Configuring analog data only to dataset 1 will not activate transmission.

Items programmed for datasets 2 through 8 will have changes in their status transmitted at a maximum rate of every 100 ms. Datasets 2 through 8 will regularly analyze each data item configured within them every 100 ms to identify if any changes have been made. If any changes in the data items are detected, these changes will be transmitted through a GOOSE message. If there are no changes detected during this 100 ms period, no GOOSE message will be sent.

For all datasets 1 through 8, the integrity GOOSE message will still continue to be sent at the pre-configured rate even if no changes in the data items are detected.

The GOOSE functionality was enhanced to prevent the relay from flooding a communications network with GOOSE messages due to an oscillation being created that is triggering a message.

The C60 has the ability of detecting if a data item in one of the GOOSE datasets is erroneously oscillating. This can be caused by events such as errors in logic programming, inputs improperly being asserted and de-asserted, or failed station components. If erroneously oscillation is detected, the C60 will stop sending GOOSE messages from the dataset for a minimum period of one second. Should the oscillation persist after the one second time-out period, the C60 will continue to block transmission of the dataset. The C60 will assert the **MAINTENANCE ALERT: GGIO Ind XXX oscill** self-test error message on the front panel display, where **XXX** denotes the data item detected as oscillating.

The configurable GOOSE feature is recommended for applications that require GOOSE data transfer between UR-series IEDs and devices from other manufacturers. Fixed GOOSE is recommended for applications that require GOOSE data transfer between UR-series IEDs.

IEC 61850 GOOSE messaging contains a number of configurable parameters, all of which must be correct to achieve the successful transfer of data. It is critical that the configured datasets at the transmission and reception devices are an exact match in terms of data structure, and that the GOOSE addresses and name strings match exactly. Manual configuration is possible, but third-party substation configuration software may be used to automate the process. The EnerVista UR Setup-software can produce IEC 61850 ICD files and import IEC 61850 SCD files produced by a substation configurator (refer to the *IEC 61850 IED configuration* section later in this appendix).

The following example illustrates the configuration required to transfer IEC 61850 data items between two devices. The general steps required for transmission configuration are:

1.   Configure the transmission dataset.

2.   Configure the GOOSE service settings.

3.   Configure the data.

The general steps required for reception configuration are:

1.   Configure the reception dataset.

2.   Configure the GOOSE service settings.

3.   Configure the data.

This example shows how to configure the transmission and reception of three IEC 61850 data items: a single point status value, its associated quality flags, and a floating point analog value.

The following procedure illustrates the transmission configuration.

1.   Configure the transmission dataset by making the following changes in the **PRODUCT SETUP** ⇨⇩ **COMMUNICATION** ⇨⇩ **IEC 61850 PROTOCOL** ⇨ **GSSE/GOOSE CONFIGURATION** ⇨ **TRANSMISSION** ⇨⇩ **CONFIGURABLE GOOSE** ⇨ **CONFIGURABLE GOOSE 1** ⇨⇩ **CONFIG GSE 1 DATASET ITEMS** settings menu:

   –   Set **ITEM 1** to "GGIO1.ST.Ind1.q" to indicate quality flags for GGIO1 status indication 1.

   –   Set **ITEM 2** to "GGIO1.ST.Ind1.stVal" to indicate the status value for GGIO1 status indication 1.

   The transmission dataset now contains a set of quality flags and a single point status Boolean value. The reception dataset on the receiving device must exactly match this structure.

2.   Configure the GOOSE service settings by making the following changes in the **PRODUCT SETUP** ⇨⇩ **COMMUNICATION** ⇨⇩ **IEC 61850 PROTOCOL** ⇨ **GSSE/GOOSE CONFIGURATION** ⇨ **TRANSMISSION** ⇨⇩ **CONFIGURABLE GOOSE** ⇨ **CONFIGU-RABLE GOOSE 1** settings menu:

   –   Set **CONFIG GSE 1 FUNCTION** to "Enabled".

   –   Set **CONFIG GSE 1 ID** to an appropriate descriptive string (the default value is "GOOSEOut_1").

   –   Set **CONFIG GSE 1 DST MAC** to a multicast address (for example, 01 00 00 12 34 56).

   –   Set the **CONFIG GSE 1 VLAN PRIORITY**; the default value of "4" is OK for this example.

   –   Set the **CONFIG GSE 1 VLAN ID** value; the default value is "0", but some switches may require this value to be "1".

   –   Set the **CONFIG GSE 1 ETYPE APPID** value. This setting represents the ETHERTYPE application ID and must match the configuration on the receiver (the default value is "0").

   –   Set the **CONFIG GSE 1 CONFREV** value. This value changes automatically as described in IEC 61850 part 7-2. For this example it can be left at its default value.

3. Configure the data by making the following changes in the **PRODUCT SETUP** ⇨⇩ **COMMUNICATION** ⇨⇩ **IEC 61850 PROTO-COL** ⇨ **GGIO1 STATUS CONFIGURATION** settings menu:

   – Set **GGIO1 INDICATION 1** to a FlexLogic™ operand used to provide the status of GGIO1.ST.Ind1.stVal (for example, a contact input, virtual input, a protection element status, etc.).

The C60 must be rebooted (control power removed and re-applied) before these settings take effect.

The following procedure illustrates the reception configuration.

1. Configure the reception dataset by making the following changes in the **PRODUCT SETUP** ⇨⇩ **COMMUNICATION** ⇨⇩ **IEC 61850 PROTOCOL** ⇨ **GSSE/GOOSE CONFIGURATION** ⇨⇩ **RECEPTION** ⇨⇩ **CONFIGURABLE GOOSE** ⇨ **CONFIGURABLE GOOSE 1** ⇨⇩ **CONFIG GSE 1 DATASET ITEMS** settings menu:

   – Set **ITEM 1** to "GGIO3.ST.Ind1.q" to indicate quality flags for GGIO3 status indication 1.

   – Set **ITEM 2** to "GGIO3.ST.Ind1.stVal" to indicate the status value for GGIO3 status indication 1.

   The reception dataset now contains a set of quality flags, a single point status Boolean value, and a floating point analog value. This matches the transmission dataset configuration above.

2. Configure the GOOSE service settings by making the following changes in the **INPUTS/OUTPUTS** ⇨⇩ **REMOTE DEVICES** ⇨⇩ **REMOTE DEVICE 1** settings menu:

   – Set **REMOTE DEVICE 1 ID** to match the GOOSE ID string for the transmitting device. Enter "GOOSEOut_1".

   – Set **REMOTE DEVICE 1 ETYPE APPID** to match the ETHERTYPE application ID from the transmitting device. This is "0" in the example above.

   – Set the **REMOTE DEVICE 1 DATASET** value. This value represents the dataset number in use. Since we are using configurable GOOSE 1 in this example, program this value as "GOOSEIn 1".

3. Configure the data by making the following changes in the **INPUTS/OUTPUTS** ⇨⇩ **REMOTE INPUTS** ⇨⇩ **REMOTE INPUT 1** settings menu:

   – Set **REMOTE IN 1 DEVICE** to "GOOSEOut_1".

   – Set **REMOTE IN 1 ITEM** to "Dataset Item 2". This assigns the value of the GGIO3.ST.Ind1.stVal single point status item to remote input 1.

Remote input 1 can now be used in FlexLogic™ equations or other settings. The C60 must be rebooted (control power removed and re-applied) before these settings take effect.

The value of remote input 1 (Boolean on or off) in the receiving device will be determined by the GGIO1.ST.Ind1.stVal value in the sending device. The above settings will be automatically populated by the EnerVista UR Setup software when a complete SCD file is created by third party substation configurator software.

For intercommunication between C60 IEDs, the fixed (DNA/UserSt) dataset can be used. The DNA/UserSt dataset contains the same DNA and UserSt bit pairs that are included in GSSE messages. All GOOSE messages transmitted by the C60 (DNA/UserSt dataset and configurable datasets) use the IEC 61850 GOOSE messaging services (for example, VLAN support).

> **NOTE**
>
> Set the **CONFIG GSE 1 FUNCTION** function to "Disabled" when configuration changes are required. Once changes are entered, return the **CONFIG GSE 1 FUNCTION** to "Enabled" and restart the unit for changes to take effect.

PATH:...TRANSMISSION ⇨⇩ **CONFIGURABLE GOOSE 1(8)** ⇨⇩ **CONIFIG GSE 1(64) DATA TIMES** ⇨ **ITEM 1(64)**

```
■ CONFIG GSE 1          ◄►   ITEM 1:
■ DATASET ITEMS              GGIO1.ST.Ind1.stVal
```

Range: *all valid MMS data item references for transmitted data*

To create a configurable GOOSE dataset that contains an IEC 61850 Single Point Status indication and its associated quality flags, the following dataset items can be selected: "GGIO1.ST.Ind1.stVal" and "GGIO1.ST.Ind1.q". The C60 will then create a dataset containing these two data items. The status value for GGIO1.ST.Ind1.stVal is determined by the FlexLogic™ operand assigned to GGIO1 indication 1. Changes to this operand will result in the transmission of GOOSE messages containing the defined dataset.

The main reception menu is applicable to configurable GOOSE only and contains the configurable GOOSE dataset items for reception:

PATH:...RECEPTION ⇨⇩ **CONFIGURABLE GOOSE 1(8)** ⇨⇩ **CONFIG GSE 1(64) DATA ITEMS**

```
■ CONFIG GSE 1          ITEM 1:                 Range:  all valid MMS data item references for
■ DATASET ITEMS   ◀▶    GGIO1.ST.Ind1.stVal             transmitted data
```

The configurable GOOSE settings allow the C60 to be configured to receive a number of different datasets within IEC 61850 GOOSE messages. Up to eight different configurable datasets can be configured for reception. This is useful for intercommunication between C60 IEDs and devices from other manufacturers that support IEC 61850.

For intercommunication between C60 IEDs, the fixed (DNA/UserSt) dataset can be used. The DNA/UserSt dataset contains the same DNA and UserSt bit pairs that are included in GSSE messages.

To set up a C60 to receive a configurable GOOSE dataset that contains two IEC 61850 single point status indications, the following dataset items can be selected (for example, for configurable GOOSE dataset 1): "GGIO3.ST.Ind1.stVal" and "GGIO3.ST.Ind2.stVal". The C60 will then create a dataset containing these two data items. The Boolean status values from these data items can be utilized as remote input FlexLogic™ operands. First, the **REMOTE DEVICE 1(16) DATASET** setting must be set to contain dataset "GOOSEIn 1" (that is, the first configurable dataset). Then **REMOTE IN 1(16) ITEM** settings must be set to "Dataset Item 1" and "Dataset Item 2". These remote input FlexLogic™ operands will then change state in accordance with the status values of the data items in the configured dataset.

Floating point analog values originating from MMXU logical nodes may be included in GOOSE datasets. Deadband (non-instantaneous) values can be transmitted. Received values are used to populate the GGIO3.XM.AnIn1 and higher items. Received values are also available as FlexAnalog parameters (GOOSE analog In1 and up).

The main menu for the IEC 61850 server configuration is shown below.

PATH: SETTINGS ⇨ **PRODUCT SETUP** ⇨⇩ **COMMUNICATIONS** ⇨⇩ **IEC 61850 PROTOCOL** ⇨⇩ **SERVER CONFIGURATION**

```
■ SERVER                    IED NAME: IECDevice        Range:  up to 32 alphanumeric characters
■ CONFIGURATION   ◀▶

         MESSAGE  ▲▼        LD INST: LDInst            Range:  up to 32 alphanumeric characters

         MESSAGE  ▲▼        LOCATION: Location         Range:  up to 80 alphanumeric characters

         MESSAGE  ▲▼        IEC/MMS TCP PORT           Range:  1 to 65535 in steps of 1
                            NUMBER:     102

         MESSAGE  ▲▼        INCLUDE NON-IEC            Range:  Disabled, Enabled
                            DATA: Enabled

         MESSAGE  ▲         SERVER SCANNING:           Range:  Disabled, Enabled
                            Disabled
```

The **IED NAME** and **LD INST** settings represent the MMS domain name (IEC 61850 logical device) where all IEC/MMS logical nodes are located. Valid characters for these values are upper and lowercase letters, numbers, and the underscore (_) character, and the first character in the string must be a letter. This conforms to the IEC 61850 standard. The **LOCATION** is a variable string and can be composed of ASCII characters. This string appears within the PhyName of the LPHD node.

The **IEC/MMS TCP PORT NUMBER** setting allows the user to change the TCP port number for MMS connections. The **INCLUDE NON-IEC DATA** setting determines whether or not the "UR" MMS domain will be available. This domain contains a large number of UR-series specific data items that are not available in the IEC 61850 logical nodes. This data does not follow the IEC 61850 naming conventions. For communications schemes that strictly follow the IEC 61850 standard, this setting should be "Disabled".

The **SERVER SCANNING** feature should be set to "Disabled" when IEC 61850 client/server functionality is not required. IEC 61850 has two modes of functionality: GOOSE/GSSE inter-device communication and client/server communication. If the GOOSE/GSSE functionality is required without the IEC 61850 client server feature, then server scanning can be disabled to increase CPU resources. When server scanning is disabled, there will be not updated to the IEC 61850 logical node status values in the C60. Clients will still be able to connect to the server (C60 relay), but most data values will not be updated. This setting does not affect GOOSE/GSSE operation.

> **NOTE**
>
> Changes to the **IED NAME** setting, **LD INST** setting, and GOOSE dataset will not take effect until the C60 is restarted.

The main menu for the IEC 61850 logical node name prefixes is shown below.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850... ⇨⇩ IEC 61850 LOGICAL NODE NAME PREFIXES

```
■ IEC 61850 LOGICAL          ◄►    ■ PIOC LOGICAL NODE
■ NODE NAME PREFIXES               ■ NAME PREFIXES

                    MESSAGE  ▲▼    ■ PTOC LOGICAL NODE
                                   ■ NAME PREFIXES

                                        ↓

                    MESSAGE  ▲     ■ PTRC LOGICAL NODE
                                   ■ NAME PREFIXES
```
The IEC 61850 logical node name prefix settings are used to create name prefixes to uniquely identify each logical node. For example, the logical node "PTOC1" may have the name prefix "abc". The full logical node name will then be "abcMMXU1". Valid characters for the logical node name prefixes are upper and lowercase letters, numbers, and the underscore (_) character, and the first character in the prefix must be a letter. This conforms to the IEC 61850 standard.

Changes to the logical node prefixes will not take effect until the C60 is restarted.

The main menu for the IEC 61850 MMXU deadbands is shown below.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨⇩ MMXU DEADBANDS

```
■ MMXU DEADBANDS            ◄►    ■ MMXU1 DEADBANDS
■                                 ■

                    MESSAGE  ▲▼    ■ MMXU2 DEADBANDS
                                   ■

                    MESSAGE  ▲▼    ■ MMXU3 DEADBANDS
                                   ■

                    MESSAGE  ▲     ■ MMXU4 DEADBANDS
                                   ■
```
The MMXU deadband settings represent the deadband values used to determine when the update the MMXU "mag" and "cVal" values from the associated "instmag" and "instcVal" values. The "mag" and "cVal" values are used for the IEC 61850 buffered and unbuffered reports. These settings correspond to the associated "db" data items in the CF functional constraint of the MMXU logical node, as per the IEC 61850 standard. According to IEC 61850-7-3, the db value "shall represent the percentage of difference between the maximum and minimum in units of 0.001%". Thus, it is important to know the maximum value for each MMXU measured quantity, since this represents the 100.00% value for the deadband.

The minimum value for all quantities is 0; the maximum values are as follows:

- phase current: $46 \times$ phase CT primary setting
- neutral current: $46 \times$ ground CT primary setting
- voltage: $275 \times$ VT ratio setting
- power (real, reactive, and apparent): $46 \times$ phase CT primary setting $\times 275 \times$ VT ratio setting
- frequency: 90 Hz
- power factor: 2

The GGIO1 status configuration points are shown below:

```

These settings are configured as follows.

- **ANALOG IN 1 VALUE**: This setting selects the FlexAnalog value to drive the instantaneous value of each GGIO4 analog status value (GGIO4.MX.AnIn1.instMag.f).

- **ANALOG IN 1 DB**: This setting specifies the deadband for each analog value. Refer to IEC 61850-7-1 and 61850-7-3 for details. The deadband is used to determine when to update the deadbanded magnitude from the instantaneous magnitude. The deadband is a percentage of the difference between the maximum and minimum values.

- **ANALOG IN 1 MIN**: This setting specifies the minimum value for each analog value. Refer to IEC 61850-7-1 and 61850-7-3 for details. This minimum value is used to determine the deadband. The deadband is used in the determination of the deadbanded magnitude from the instantaneous magnitude.

- **ANALOG IN 1 MAX**: This setting defines the maximum value for each analog value. Refer to IEC 61850-7-1 and 61850-7-3 for details. This maximum value is used to determine the deadband. The deadband is used in the determination of the deadbanded magnitude from the instantaneous magnitude.

> **NOTE**
> Note that the **ANALOG IN 1 MIN** and **ANALOG IN 1 MAX** settings are stored as IEEE 754 / IEC 60559 floating point numbers. Because of the large range of these settings, not all values can be stored. Some values may be rounded to the closest possible floating point number.

The report control configuration settings are shown below:

PATH: SETTINGS ⇨ **PRODUCT SETUP** ⇨⇩ **COMMUNICATIONS** ⇨⇩ **IEC 61850...** ⇨⇩ **REPORT...** ⇨ **REPORT 1(6) CONFIGURATION**

```

                      MESSAGE ▲     REPORT 1                 Range:  0 to 4294967295 in steps of 1
                                    IntgPd:         0
```

Changes to the report configuration will not take effect until the C60 is restarted.

> **NOTE**
> Please disconnect any IEC 61850 client connection to the C60 prior to making setting changes to the report configuration. Disconnecting the rear Ethernet connection from the C60 will disconnect the IEC 61850 client connection.

The breaker configuration settings are shown below. Changes to these values will not take effect until the UR is restarted:

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨⇩ XCBR CONFIGURATION

■ XCBR ■ CONFIGURATION	◀▷	XCBR1 ST.LOC OPERAND Off	*Range: FlexLogic™ operand*
MESSAGE ▲▼		XCBR2 ST.LOC OPERAND Off	*Range: FlexLogic™ operand*

↓

MESSAGE ▲▼		XCBR6 ST.LOC OPERAND Off	*Range: FlexLogic™ operand*
MESSAGE ▲▼		CLEAR XCBR1 OpCnt: No	*Range: No, Yes*
MESSAGE ▲▼		CLEAR XCBR2 OpCnt: No	*Range: No, Yes*

↓

MESSAGE ▲		CLEAR XCBR6 OpCnt: No	*Range: No, Yes*

The **CLEAR XCBR1 OpCnt** setting represents the breaker operating counter. As breakers operate by opening and closing, the XCBR operating counter status attribute (OpCnt) increments with every operation. Frequent breaker operation may result in very large OpCnt values over time. This setting allows the OpCnt to be reset to "0" for XCBR1.

> **NOTE**
> Since GSSE/GOOSE messages are multicast Ethernet by specification, they will not usually be forwarded by network routers. However, GOOSE messages may be fowarded by routers if the router has been configured for VLAN functionality.

h) WEB SERVER HTTP PROTOCOL

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ WEB SERVER HTTP PROTOCOL

■ WEB SERVER ■ HTTP PROTOCOL	◀▷	HTTP TCP PORT NUMBER: 80	*Range: 1 to 65535 in steps of 1*

The C60 contains an embedded web server and is capable of transferring web pages to a web browser such as Microsoft Internet Explorer or Mozilla Firefox. This feature is available only if the C60 has the ethernet option installed. The web pages are organized as a series of menus that can be accessed starting at the C60 "Main Menu". Web pages are available showing DNP and IEC 60870-5-104 points lists, Modbus registers, event records, fault reports, etc. The web pages can be accessed by connecting the UR and a computer to an ethernet network. The main menu will be displayed in the web browser on the computer simply by entering the IP address of the C60 into the "Address" box on the web browser.

i) TFTP PROTOCOL

MESSAGE ⬆⬇	IEC ENERGY DEFAULT THRESHOLD: 30000	*Range: 0 to 65535 in steps of 1*
MESSAGE ⬆	IEC OTHER DEFAULT THRESHOLD: 30000	*Range: 0 to 65535 in steps of 1*

The C60 supports the IEC 60870-5-104 protocol. The C60 can be used as an IEC 60870-5-104 slave device connected to a maximum of two masters (usually either an RTU or a SCADA master station). Since the C60 maintains two sets of IEC 60870-5-104 data change buffers, no more than two masters should actively communicate with the C60 at one time.

The **IEC ------- DEFAULT THRESHOLD** settings are used to determine when to trigger spontaneous responses containing M_ME_NC_1 analog data. These settings group the C60 analog data into types: current, voltage, power, energy, and other. Each setting represents the default threshold value for all M_ME_NC_1 analog points of that type. For example, to trigger spontaneous responses from the C60 when any current values change by 15 A, the **IEC CURRENT DEFAULT THRESHOLD** setting should be set to 15. Note that these settings are the default values of the deadbands. P_ME_NC_1 (parameter of measured value, short floating point value) points can be used to change threshold values, from the default, for each individual M_ME_NC_1 analog point. Whenever power is removed and re-applied to the C60, the default thresholds will be in effect.

> **NOTE**
> **The IEC 60870-5-104 and DNP protocols cannot be used simultaneously. When the IEC 60870-5-104 FUNCTION setting is set to "Enabled", the DNP protocol will not be operational. When this setting is changed it will not become active until power to the relay has been cycled (off-to-on).**

k) SNTP PROTOCOL

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ SNTP PROTOCOL

■ SNTP PROTOCOL ■ ◀▶	SNTP FUNCTION: Disabled	*Range: Enabled, Disabled*
MESSAGE ⬆⬇	SNTP SERVER IP ADDR: 0.0.0.0	*Range: Standard IP address format*
MESSAGE ⬆	SNTP UDP PORT NUMBER: 123	*Range: 0 to 65535 in steps of 1*

The C60 supports the Simple Network Time Protocol specified in RFC-2030. With SNTP, the C60 can obtain clock time over an Ethernet network. The C60 acts as an SNTP client to receive time values from an SNTP/NTP server, usually a dedicated product using a GPS receiver to provide an accurate time. Both unicast and broadcast SNTP are supported.

If SNTP functionality is enabled at the same time as IRIG-B, the IRIG-B signal provides the time value to the C60 clock for as long as a valid signal is present. If the IRIG-B signal is removed, the time obtained from the SNTP server is used. If either SNTP or IRIG-B is enabled, the C60 clock value cannot be changed using the front panel keypad.

To use SNTP in unicast mode, **SNTP SERVER IP ADDR** must be set to the SNTP/NTP server IP address. Once this address is set and **SNTP FUNCTION** is "Enabled", the C60 attempts to obtain time values from the SNTP/NTP server. Since many time values are obtained and averaged, it generally takes three to four minutes until the C60 clock is closely synchronized with the SNTP/NTP server. It may take up to two minutes for the C60 to signal an SNTP self-test error if the server is offline.

To use SNTP in broadcast mode, set the **SNTP SERVER IP ADDR** setting to "0.0.0.0" and **SNTP FUNCTION** to "Enabled". The C60 then listens to SNTP messages sent to the "all ones" broadcast address for the subnet. The C60 waits up to eighteen minutes (>1024 seconds) without receiving an SNTP broadcast message before signaling an SNTP self-test error.

The UR-series relays do not support the multicast or anycast SNTP functionality.

I) EGD PROTOCOL

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ EGD PROTOCOL
The C60 Breaker Protection System is provided with optional Ethernet Global Data (EGD) communications capability. This feature is specified as a software option at the time of ordering. Refer to the *Ordering* section of chapter 2 for additional details. The Ethernet Global Data (EGD) protocol feature is not available if CPU Type E is ordered.

The relay supports one fast Ethernet Global Data (EGD) exchange and two slow EGD exchanges. There are 20 data items in the fast-produced EGD exchange and 50 data items in each slow-produced exchange.

Ethernet Global Data (EGD) is a suite of protocols used for the real-time transfer of data for display and control purposes. The relay can be configured to 'produce' EGD data exchanges, and other devices can be configured to 'consume' EGD data exchanges. The number of produced exchanges (up to three), the data items in each exchange (up to 50), and the exchange production rate can be configured.

EGD cannot be used to transfer data between UR-series relays. The relay supports EGD production only. An EGD exchange will not be transmitted unless the destination address is non-zero, and at least the first data item address is set to a valid Modbus register address. Note that the default setting value of "0" is considered invalid.

The settings menu for the fast EGD exchange is shown below:

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ EGD PROTOCOL ⇨ FAST PROD EXCH 1 CONFIGURATION
Fast exchanges (50 to 1000 ms) are generally used in control schemes. The C60 has one fast exchange (Exchange 1) and two slow exchanges (Exchanges 2 and 3).

The settings menu for the slow EGD exchanges is shown below:

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ ⇩ COMMUNICATIONS ⇨ ⇩ EGD PROTOCOL ⇨ SLOW PROD EXCH 1(2) CONFIGURATION

■ SLOW PROD EXCH 1 ■ CONFIGURATION	◀▶	EXCH 1 FUNCTION: Disable	*Range: Disable, Enable*
MESSAGE	⬆⬇	EXCH 1 DESTINATION: 0.0.0.0	*Range: standard IP address*
MESSAGE	⬆⬇	EXCH 1 DATA RATE: 1000 ms	*Range: 500 to 1000 ms in steps of 1*
MESSAGE	⬆⬇	EXCH 1 DATA ITEM 1: 0	*Range: 0 to 65535 in steps of 1 (Modbus register address range in decimal)*
		↓	
MESSAGE	⬆	EXCH 1 DATA ITEM 50: 0	*Range: 0 to 65535 in steps of 1 (Modbus register address range in decimal)*

Slow EGD exchanges (500 to 1000 ms) are generally used for the transfer and display of data items. The settings for the fast and slow exchanges are described below:

- **EXCH 1 DESTINATION**: This setting specifies the destination IP address of the produced EGD exchange. This is usually unicast or broadcast.

- **EXCH 1 DATA RATE**: This setting specifies the rate at which this EGD exchange is transmitted. If the setting is 50 ms, the exchange data will be updated and sent once every 50 ms. If the setting is 1000 ms, the exchange data will be updated and sent once per second. EGD exchange 1 has a setting range of 50 to 1000 ms. Exchanges 2 and 3 have a setting range of 500 to 1000 ms.

- **EXCH 1 DATA ITEM 1 to 20/50**: These settings specify the data items that are part of this EGD exchange. Almost any data from the C60 memory map can be configured to be included in an EGD exchange. The settings are the starting Modbus register address for the data item in decimal format. Refer to Appendix B for the complete Modbus memory map. Note that the Modbus memory map displays shows addresses in hexadecimal format; as such, it will be necessary to convert these values to decimal format before entering them as values for these setpoints.

  To select a data item to be part of an exchange, it is only necessary to choose the starting Modbus address of the item. That is, for items occupying more than one Modbus register (for example, 32 bit integers and floating point values), only the first Modbus address is required. The EGD exchange configured with these settings contains the data items up to the first setting that contains a Modbus address with no data, or 0. That is, if the first three settings contain valid Modbus addresses and the fourth is 0, the produced EGD exchange will contain three data items.

m) ETHERNET SWITCH

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ ⇩ COMMUNICATIONS ⇨ ⇩ ETHERNET SWITCH

■ ETHERNET SWITCH ■	◀▶	SWITCH IP ADDRESS: 127.0.0.1	*Range: standard IP address format*
MESSAGE	⬆⬇	SWITCH MODBUS TCP PORT NUMBER: 502	*Range: 1 to 65535 in steps of 1*
MESSAGE	⬆⬇	PORT 1 EVENTS: Disabled	*Range: Enabled, Disabled*
MESSAGE	⬆⬇	PORT 2 EVENTS: Disabled	*Range: Enabled, Disabled*
		↓	
MESSAGE	⬆	PORT 6 EVENTS: Disabled	*Range: Enabled, Disabled*

These settings appear only if the C60 is ordered with an Ethernet switch module (type 2S or 2T).

The IP address and Modbus TCP port number for the Ethernet switch module are specified in this menu. These settings are used in advanced network configurations. Please consult the network administrator before making changes to these settings. The client software (EnerVista UR Setup, for example) is the preferred interface to configure these settings.

The **PORT 1 EVENTS** through **PORT 6 EVENTS** settings allow Ethernet switch module events to be logged in the event recorder.

5.2.5 MODBUS USER MAP

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ ⇩ MODBUS USER MAP

```
■ MODBUS USER MAP       ◀▷   ADDRESS   1:      0     Range:  0 to 65535 in steps of 1
■                            VALUE:       0

          MESSAGE        ▲    ADDRESS   2:      0     Range:  0 to 65535 in steps of 1
                         ▼    VALUE:       0

                                    ↓

          MESSAGE        ▲    ADDRESS 256:      0     Range:  0 to 65535 in steps of 1
                              VALUE:       0
```

The Modbus user map provides read-only access for up to 256 registers. To obtain a memory map value, enter the desired address in the **ADDRESS** line (this value must be converted from hex to decimal format). The corresponding value is displayed in the **VALUE** line. A value of "0" in subsequent register **ADDRESS** lines automatically returns values for the previous **ADDRESS** lines incremented by "1". An address value of "0" in the initial register means "none" and values of "0" will be displayed for all registers. Different **ADDRESS** values can be entered as required in any of the register positions.

5

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ ⇩ REAL TIME CLOCK

■ REAL TIME ■ CLOCK	**IRIG-B SIGNAL TYPE:** **None**	*Range: None, DC Shift, Amplitude Modulated*
MESSAGE	**REAL TIME CLOCK** **EVENTS: Disabled**	*Range: Disabled, Enabled*
MESSAGE	**LOCAL TIME OFFSET** **FROM UTC: 0.0 hrs**	*Range: –24.0 to 24.0 hrs in steps of 0.5*
MESSAGE	**DAYLIGHT SAVINGS** **TIME: Disabled**	*Range: Disabled, Enabled*

MESSAGE	**DST STOP DAY** **INSTANCE: First**	*Range: First, Second, Third, Fourth, Last*
MESSAGE	**DST STOP HOUR:** ** 2:00**	*Range: 0:00 to 23:00*

The date and time can be synchronized a known time base and to other relays using an IRIG-B signal. It has the same accuracy as an electronic watch, approximately ±1 minute per month. If an IRIG-B signal is connected to the relay, only the current year needs to be entered. See the **COMMANDS ⇨ ⇩ SET DATE AND TIME** menu to manually set the relay clock.

The **REAL TIME CLOCK EVENTS** setting allows changes to the date and/or time to be captured in the event record.

The **LOCAL TIME OFFSET FROM UTC** setting is used to specify the local time zone offset from Universal Coordinated Time (Greenwich Mean Time) in hours. This setting has two uses. When the C60 is time synchronized with IRIG-B, or has no permanent time synchronization, the offset is used to calculate UTC time for IEC 61850 features. When the C60 is time synchronized with SNTP, the offset is used to determine the local time for the C60 clock, since SNTP provides UTC time.

The daylight savings time (DST) settings can be used to allow the C60 clock can follow the DST rules of the local time zone. Note that when IRIG-B time synchronization is active, the DST settings are ignored. The DST settings are used when the C60 is synchronized with SNTP, or when neither SNTP nor IRIG-B is used.

> **NOTE**
> Only timestamps in the event recorder and communications protocols are affected by the daylight savings time settings. The reported real-time clock value does not change.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ FAULT REPORTS ⇨ FAULT REPORT 1

The C60 relay supports one fault report and an associated fault locator. The signal source and trigger condition, as well as the characteristics of the line or feeder, are entered in this menu.

The fault report stores data, in non-volatile memory, pertinent to an event when triggered. The captured data contained in the `FaultReport.txt` file includes:

- Fault report number
- Name of the relay, programmed by the user
- Firmware revision of the relay
- Date and time of trigger
- Name of trigger (specific operand)
- Line/feeder ID via the name of a configured signal source
- Active setting group at the time of trigger
- Pre-fault current and voltage phasors (two cycles before either a 50DD disturbance associated with fault report source or the trigger operate)
- Fault current and voltage phasors (one cycle after the trigger)
- Elements operated at the time of triggering
- Events: 9 before trigger and 7 after trigger (only available via the relay webpage)
- Fault duration times for each breaker (created by the breaker arcing current feature)

The captured data also includes the fault type and the distance to the fault location, as well as the reclose shot number (when applicable) To include fault duration times in the fault report, the user must enable and configure breaker arcing current feature for each of the breakers. Fault duration is reported on a per-phase basis.

The relay allows locating faults, including ground faults, from delta-connected VTs. In this case, the missing zero-sequence voltage is substituted either by the externally provided neutral voltage (broken delta VT) connected to the auxiliary voltage channel of a VT bank, or by the zero-sequence voltage approximated as a voltage drop developed by the zero-sequence current, and user-provided zero-sequence equivalent impedance of the system behind the relay.

The trigger can be any FlexLogic™ operand, but in most applications it is expected to be the same operand, usually a virtual output, that is used to drive an output relay to trip a breaker. To prevent the overwriting of fault events, the disturbance detector should not be used to trigger a fault report. A FAULT RPT TRIG event is automatically created when the report is triggered.

If a number of protection elements are ORed to create a fault report trigger, the first operation of any element causing the OR gate output to become high triggers a fault report. However, If other elements operate during the fault and the first operated element has not been reset (the OR gate output is still high), the fault report is not triggered again. Considering the reset time of protection elements, there is very little chance that fault report can be triggered twice in this manner. As the fault report must capture a usable amount of pre and post-fault data, it can not be triggered faster than every 20 ms.

Each fault report is stored as a file; the relay capacity is fifteen (15) files. An sixteenth (16th) trigger overwrites the oldest file.

The EnerVista UR Setup software is required to view all captured data. The relay faceplate display can be used to view the date and time of trigger, the fault type, the distance location of the fault, and the reclose shot number.

The **FAULT REPORT 1 SOURCE** setting selects the source for input currents and voltages and disturbance detection.

The **FAULT 1 REPORT TRIG** setting assigns the FlexLogic™ operand representing the protection element/elements requiring operational fault location calculations. The distance to fault calculations are initiated by this signal. The **FAULT REPORT 1 Z1 MAG** and **FAULT REPORT 1 Z0 MAG** impedances are entered in secondary ohms.

The **FAULT REPORT 1 VT SUBSTITUTION** setting shall be set to "None" if the relay is fed from wye-connected VTs. If delta-connected VTs are used, and the relay is supplied with the neutral (3V0) voltage, this setting shall be set to "V0". The method is still exact, as the fault locator would combine the line-to-line voltage measurements with the neutral voltage measurement to re-create the line-to-ground voltages. See the **ACTUAL VALUES ⇨⇩ RECORDS ⇨ FAULT REPORTS** menu for additional details. It required to configure the delta and neutral voltages under the source indicated as input for the fault report. Also, the relay will check if the auxiliary signal configured is marked as "Vn" by the user (under VT setup), and inhibit the fault location if the auxiliary signal is labeled differently.

If the broken-delta neutral voltage is not available to the relay, an approximation is possible by assuming the missing zero-sequence voltage to be an inverted voltage drop produced by the zero-sequence current and the user-specified equivalent zero-sequence system impedance behind the relay: V0 = –Z0 × I0. In order to enable this mode of operation, the **FAULT REPORT 1 VT SUBSTITUTION** setting shall be set to "I0".

The **FAULT REP 1 SYSTEM Z0 MAG** and **FAULT REP 1 SYSTEM Z0 ANGLE** settings are used only when the **VT SUBSTITUTION** setting value is "I0". The magnitude is to be entered in secondary ohms. This impedance is an average system equivalent behind the relay. It can be calculated as zero-sequence Thevenin impedance at the local bus with the protected line/feeder disconnected. The method is accurate only if this setting matches perfectly the actual system impedance during the fault. If the system exhibits too much variability, this approach is questionable and the fault location results for single-line-to-ground faults shall be trusted with accordingly. It should be kept in mind that grounding points in vicinity of the installation impact the system zero-sequence impedance (grounded loads, reactors, zig-zag transformers, shunt capacitor banks, etc.).

```

Oscillography records contain waveforms captured at the sampling rate as well as other relay data at the point of trigger. Oscillography records are triggered by a programmable FlexLogic™ operand. Multiple oscillography records may be captured simultaneously.

The **NUMBER OF RECORDS** is selectable, but the number of cycles captured in a single record varies considerably based on other factors such as sample rate and the number of operational modules. There is a fixed amount of data storage for oscillography; the more data captured, the less the number of cycles captured per record. See the **ACTUAL VALUES** ⇨⇩ **RECORDS** ⇨⇩ **OSCILLOGRAPHY** menu to view the number of cycles captured per record. The following table provides sample configurations with corresponding cycles/record.

Table 5–1: OSCILLOGRAPHY CYCLES/RECORD EXAMPLE

RECORDS	CT/VTS	SAMPLE RATE	DIGITALS	ANALOGS	CYCLES/ RECORD
1	1	8	0	0	1872.0
1	1	16	16	0	1685.0
8	1	16	16	0	276.0
8	1	16	16	4	219.5
8	2	16	16	4	93.5
8	2	16	64	16	93.5
8	2	32	64	16	57.6
8	2	64	64	16	32.3
32	2	64	64	16	9.5

A new record may automatically overwrite an older record if **TRIGGER MODE** is set to "Automatic Overwrite".

Set the **TRIGGER POSITION** to a percentage of the total buffer size (for example, 10%, 50%, 75%, etc.). A trigger position of 25% consists of 25% pre- and 75% post-trigger data. The **TRIGGER SOURCE** is always captured in oscillography and may be any FlexLogic™ parameter (element state, contact input, virtual output, etc.). The relay sampling rate is 64 samples per cycle.

The **AC INPUT WAVEFORMS** setting determines the sampling rate at which AC input signals (that is, current and voltage) are stored. Reducing the sampling rate allows longer records to be stored. This setting has no effect on the internal sampling rate of the relay which is always 64 samples per cycle; that is, it has no effect on the fundamental calculations of the device.

⚠️ **WARNING**   **When changes are made to the oscillography settings, all existing oscillography records will be CLEARED.**

b) DIGITAL CHANNELS

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ OSCILLOGRAPHY ⇨⇩ DIGITAL CHANNELS

```
■ DIGITAL CHANNELS            ◀▮▶        DIGITAL CHANNEL  1:        Range:  FlexLogic™ operand
■                                        Off
```
```
              MESSAGE         ▲▼         DIGITAL CHANNEL  2:        Range:  FlexLogic™ operand

```

These settings select the metering actual value recorded in an oscillography trace. The length of each oscillography trace depends in part on the number of parameters selected here. Parameters set to "Off" are ignored. The parameters available in a given relay are dependent on:

• The type of relay,

• The type and number of CT/VT hardware modules installed, et

• The type and number of analog input hardware modules installed.

Upon startup, the relay will automatically prepare the parameter list. A list of all possible analog metering actual value parameters is presented in Appendix A: *FlexAnalog parameters*. The parameter index number shown in any of the tables is used to expedite the selection of the parameter on the relay display. It can be quite time-consuming to scan through the list of parameters via the relay keypad and display - entering this number via the relay keypad will cause the corresponding parameter to be displayed.

All eight CT/VT module channels are stored in the oscillography file. The CT/VT module channels are named as follows:

<slot_letter><terminal_number>—<I or *V><phase A*, *B*, or *C*, or *4th input>*

The fourth current input in a bank is called IG, and the fourth voltage input in a bank is called VX. For example, F2-IB designates the IB signal on terminal 2 of the CT/VT module in slot F.

If there are no CT/VT modules and analog input modules, no analog traces will appear in the file; only the digital traces will appear.

                               Off                              FlexAnalog Parameters for complete list.
```

```
              MESSAGE  ⬆       DATA LOGGER  CONFIG:     Range:  Not applicable - shows computed data only
                                0 CHNL x   0.0 DAYS
```

The data logger samples and records up to 16 analog parameters at a user-defined sampling rate. This recorded data may be downloaded to EnerVista UR Setup and displayed with *parameters* on the vertical axis and *time* on the horizontal axis. All data is stored in non-volatile memory, meaning that the information is retained when power to the relay is lost.

For a fixed sampling rate, the data logger can be configured with a few channels over a long period or a larger number of channels for a shorter period. The relay automatically partitions the available memory between the channels in use. Example storage capacities for a system frequency of 60 Hz are shown in the following table.

Table 5–2: DATA LOGGER STORAGE CAPACITY EXAMPLE

SAMPLING RATE	CHANNELS	DAYS	STORAGE CAPACITY
15 ms	1	0.1	954 s
	8	0.1	120 s
	9	0.1	107 s
	16	0.1	60 s
1000 ms	1	0.7	65457 s
	8	0.1	8182 s
	9	0.1	7273 s
	16	0.1	4091 s
60000 ms	1	45.4	3927420 s
	8	5.6	490920 s
	9	5	436380 s
	16	2.8	254460 s
3600000 ms	1	2727.5	235645200 s
	8	340.9	29455200 s
	9	303	26182800 s

> **NOTE**
> **Changing any setting affecting data logger operation will clear any data that is currently in the log.**

- **DATA LOGGER MODE**: This setting configures the mode in which the data logger will operate. When set to "Continuous", the data logger will actively record any configured channels at the rate as defined by the **DATA LOGGER RATE**. The

data logger will be idle in this mode if no channels are configured. When set to "Trigger", the data logger will begin to record any configured channels at the instance of the rising edge of the **DATA LOGGER TRIGGER** source FlexLogic™ operand. *The data logger will ignore all subsequent triggers* and will continue to record data until the active record is full. Once the data logger is full a **CLEAR DATA LOGGER** command is required to clear the data logger record before a new record can be started. Performing the **CLEAR DATA LOGGER** command will also stop the current record and reset the data logger to be ready for the next trigger.

- **DATA LOGGER TRIGGER**: This setting selects the signal used to trigger the start of a new data logger record. Any FlexLogic™ operand can be used as the trigger source. The **DATA LOGGER TRIGGER** setting only applies when the mode is set to "Trigger".

- **DATA LOGGER RATE:** This setting selects the time interval at which the actual value data will be recorded.

- **DATA LOGGER CHNL 1(16):** This setting selects the metering actual value that is to be recorded in Channel 1(16) of the data log. The parameters available in a given relay are dependent on: the type of relay, the type and number of CT/VT hardware modules installed, and the type and number of Analog Input hardware modules installed. Upon startup, the relay will automatically prepare the parameter list. A list of all possible analog metering actual value parameters is shown in Appendix A: *FlexAnalog Parameters*. The parameter index number shown in any of the tables is used to expedite the selection of the parameter on the relay display. It can be quite time-consuming to scan through the list of parameters via the relay keypad/display – entering this number via the relay keypad will cause the corresponding parameter to be displayed.

- **DATA LOGGER CONFIG:** This display presents the total amount of time the Data Logger can record the channels not selected to "Off" without over-writing old data.

5.2.10 DEMAND

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ ⇩ DEMAND

■ DEMAND ■	◀▶	CRNT DEMAND METHOD: Thermal Exponential	Range:	Thermal Exponential, Block Interval, Rolling Demand
MESSAGE	▲▼	POWER DEMAND METHOD: Thermal Exponential	Range:	Thermal Exponential, Block Interval, Rolling Demand
MESSAGE	▲▼	DEMAND INTERVAL: 15 MIN	Range:	5, 10, 15, 20, 30, 60 minutes
MESSAGE	▲	DEMAND TRIGGER: Off	Range:	FlexLogic™ operand Note: for calculation using Method 2a

The relay measures current demand on each phase, and three-phase demand for real, reactive, and apparent power. Current and Power methods can be chosen separately for the convenience of the user. Settings are provided to allow the user to emulate some common electrical utility demand measuring techniques, for statistical or control purposes. If the **CRNT DEMAND METHOD** is set to "Block Interval" and the **DEMAND TRIGGER** is set to "Off", Method 2 is used (see below). If **DEMAND TRIGGER** is assigned to any other FlexLogic™ operand, Method 2a is used (see below).

The relay can be set to calculate demand by any of three methods as described below:

CALCULATION METHOD 1: THERMAL EXPONENTIAL

This method emulates the action of an analog peak recording thermal demand meter. The relay measures the quantity (RMS current, real power, reactive power, or apparent power) on each phase every second, and assumes the circuit quantity remains at this value until updated by the next measurement. It calculates the 'thermal demand equivalent' based on the following equation:

$$d(t) = D(1 - e^{-kt})$$ **(EQ 5.6)**

where: d = demand value after applying input quantity for time t (in minutes)
        D = input quantity (constant), and k = 2.3 / thermal 90% response time.

The 90% thermal response time characteristic of 15 minutes is illustrated below. A setpoint establishes the time to reach 90% of a steady-state value, just as the response time of an analog instrument. A steady state value applied for twice the response time will indicate 99% of the value.
Figure 5–3: THERMAL DEMAND CHARACTERISTIC

CALCULATION METHOD 2: BLOCK INTERVAL

This method calculates a linear average of the quantity (RMS current, real power, reactive power, or apparent power) over the programmed demand time interval, starting daily at 00:00:00 (i.e. 12:00 am). The 1440 minutes per day is divided into the number of blocks as set by the programmed time interval. Each new value of demand becomes available at the end of each time interval.

CALCULATION METHOD 2a: BLOCK INTERVAL (with Start Demand Interval Logic Trigger)

This method calculates a linear average of the quantity (RMS current, real power, reactive power, or apparent power) over the interval between successive Start Demand Interval logic input pulses. Each new value of demand becomes available at the end of each pulse. Assign a FlexLogic™ operand to the **DEMAND TRIGGER** setting to program the input for the new demand interval pulses.

> **NOTE**
> If no trigger is assigned in the **DEMAND TRIGGER** setting and the **CRNT DEMAND METHOD** is "Block Interval", use calculating method #2. If a trigger is assigned, the maximum allowed time between 2 trigger signals is 60 minutes. If no trigger signal appears within 60 minutes, demand calculations are performed and available and the algorithm resets and starts the new cycle of calculations. The minimum required time for trigger contact closure is 20 μs.

CALCULATION METHOD 3: ROLLING DEMAND

This method calculates a linear average of the quantity (RMS current, real power, reactive power, or apparent power) over the programmed demand time interval, in the same way as Block Interval. The value is updated every minute and indicates the demand over the time interval just preceding the time of update.

5.2.11 USER-PROGRAMMABLE LEDS

a) MAIN MENU

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ USER-PROGRAMMABLE LEDS

■ USER-PROGRAMMABLE ■ LEDS	◄■►	■ LED TEST ■	See below
MESSAGE	⬆⬇	■ TRIP & ALARM LEDS ■	See page 5-44.

		↓	
MESSAGE	⬆	■ USER-PROGRAMMABLE ■ LED 48	
b) LED TEST

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ ⇩ USER-PROGRAMMABLE LEDS ⇨ LED TEST

■ LED TEST ■	◀▶	LED TEST FUNCTION: Disabled	*Range: Disabled, Enabled.*
	MESSAGE ▲	LED TEST CONTROL: Off	*Range: FlexLogic™ operand*

When enabled, the LED test can be initiated from any digital input or user-programmable condition such as user-programmable pushbutton. The control operand is configured under the **LED TEST CONTROL** setting. The test covers all LEDs, including the LEDs of the optional user-programmable pushbuttons.

The test consists of three stages.

1. All 62 LEDs on the relay are illuminated. This is a quick test to verify if any of the LEDs is "burned". This stage lasts as long as the control input is on, up to a maximum of 1 minute. After 1 minute, the test will end.

2. All the LEDs are turned off, and then one LED at a time turns on for 1 second, then back off. The test routine starts at the top left panel, moving from the top to bottom of each LED column. This test checks for hardware failures that lead to more than one LED being turned on from a single logic point. This stage can be interrupted at any time.

3. All the LEDs are turned on. One LED at a time turns off for 1 second, then back on. The test routine starts at the top left panel moving from top to bottom of each column of the LEDs. This test checks for hardware failures that lead to more than one LED being turned off from a single logic point. This stage can be interrupted at any time.

When testing is in progress, the LEDs are controlled by the test sequence, rather than the protection, control, and monitoring features. However, the LED control mechanism accepts all the changes to LED states generated by the relay and stores the actual LED states (on or off) in memory. When the test completes, the LEDs reflect the actual state resulting from relay response during testing. The reset pushbutton will not clear any targets when the LED Test is in progress.

A dedicated FlexLogic™ operand, LED TEST IN PROGRESS, is set for the duration of the test. When the test sequence is initiated, the LED TEST INITIATED event is stored in the event recorder.

The entire test procedure is user-controlled. In particular, stage 1 can last as long as necessary, and stages 2 and 3 can be interrupted. The test responds to the position and rising edges of the control input defined by the **LED TEST CONTROL** setting. The control pulses must last at least 250 ms to take effect. The following diagram explains how the test is executed.
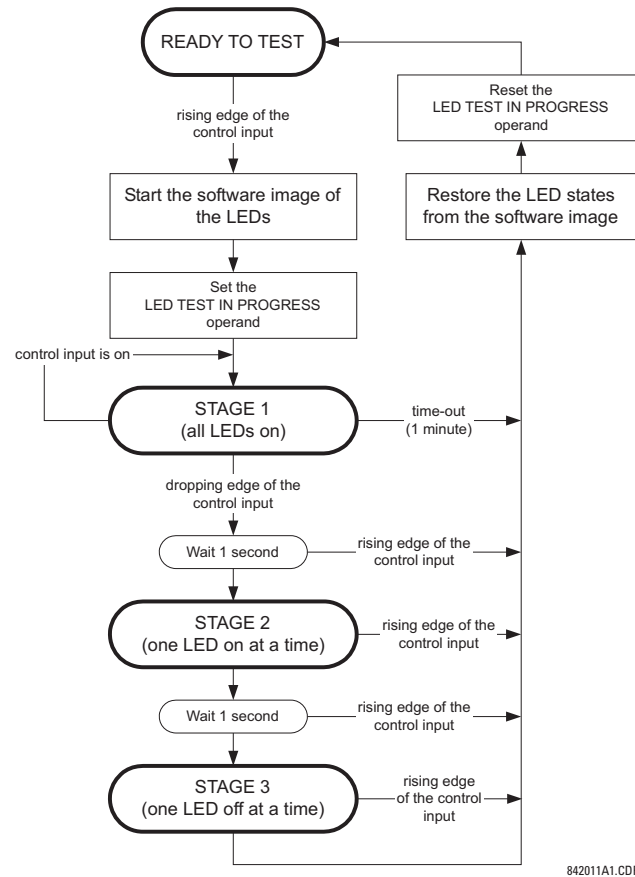

Figure 5–4: LED TEST SEQUENCE

Application Example 1:

Assume one needs to check if any of the LEDs is "burned" through user-programmable pushbutton 1. The following settings should be applied. Configure user-programmable pushbutton 1 by making the following entries in the **SETTINGS** ⇨ **PRODUCT SETUP** ⇨⇩ **USER-PROGRAMMABLE PUSHBUTTONS** ⇨ **USER PUSHBUTTON 1** menu:

> **PUSHBUTTON 1 FUNCTION:** "Self-reset"
> **PUSHBTN 1 DROP-OUT TIME:** "0.10 s"

Configure the LED test to recognize user-programmable pushbutton 1 by making the following entries in the **SETTINGS** ⇨ **PRODUCT SETUP** ⇨⇩ **USER-PROGRAMMABLE LEDS** ⇨ **LED TEST** menu:

> **LED TEST FUNCTION:** "Enabled"
> **LED TEST CONTROL:** "PUSHBUTTON 1 ON"

The test will be initiated when the user-programmable pushbutton 1 is pressed. The pushbutton should remain pressed for as long as the LEDs are being visually inspected. When finished, the pushbutton should be released. The relay will then automatically start stage 2. At this point forward, test may be aborted by pressing the pushbutton.

Application Example 2:

Assume one needs to check if any LEDs are "burned" as well as exercise one LED at a time to check for other failures. This is to be performed via user-programmable pushbutton 1.

After applying the settings in application example 1, hold down the pushbutton as long as necessary to test all LEDs. Next, release the pushbutton to automatically start stage 2. Once stage 2 has started, the pushbutton can be released. When stage 2 is completed, stage 3 will automatically start. The test may be aborted at any time by pressing the pushbutton.

c) TRIP AND ALARM LEDS

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ USER-PROGRAMMABLE LEDS ⇨⇩ TRIP & ALARM LEDS

```

MESSAGE ▲
```
ALARM LED INPUT:
Off
```
Range: FlexLogic™ operand

The trip and alarm LEDs are in the first LED column (enhanced faceplate) and on LED panel 1 (standard faceplate). Each indicator can be programmed to become illuminated when the selected FlexLogic™ operand is in the logic 1 state.

d) USER-PROGRAMMABLE LED 1(48)

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ USER-PROGRAMMABLE LEDS ⇨⇩ USER-PROGRAMMABLE LED 1(48)

```
■ USER-PROGRAMMABLE
■ LED 1
```
◄►
```
LED 1 OPERAND:
Off
```
Range: FlexLogic™ operand

MESSAGE ▲
```
LED 1 TYPE:
Self-Reset
```
Range: Self-Reset, Latched

There are 48 amber LEDs across the relay faceplate LED panels. Each of these indicators can be programmed to illuminate when the selected FlexLogic™ operand is in the logic 1 state.

For the standard faceplate, the LEDs are located as follows.

- LED Panel 2: user-programmable LEDs 1 through 24
- LED Panel 3: user programmable LEDs 25 through 48

For the enhanced faceplate, the LEDs are located as follows.

- LED column 2: user-programmable LEDs 1 through 12
- LED column 3: user-programmable LEDs 13 through 24
- LED column 4: user-programmable LEDs 25 through 36
- LED column 5: user-programmable LEDs 37 through 48

Refer to the *LED indicators* section in chapter 4 for additional information on the location of these indexed LEDs.

The user-programmable LED settings select the FlexLogic™ operands that control the LEDs. If the **LED 1 TYPE** setting is "Self-Reset" (the default setting), the LED illumination will track the state of the selected LED operand. If the **LED 1 TYPE** setting is "Latched", the LED, once lit, remains so until reset by the faceplate RESET button, from a remote device via a communications channel, or from any programmed operand, even if the LED operand state de-asserts.

Table 5–3: RECOMMENDED SETTINGS FOR USER-PROGRAMMABLE LEDS

SETTING	PARAMETER	SETTING	PARAMETER

Refer to the *Control of setting groups* example in the *Control elements* section of this chapter for group activation.

5.2.12 USER-PROGRAMMABLE SELF TESTS

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ USER-PROGRAMMABLE SELF TESTS

■ USER-PROGRAMMABLE ■ SELF TESTS	DIRECT RING BREAK FUNCTION: Enabled	*Range:* *Disabled, Enabled. Valid for units equipped with Direct Input/Output module.*
MESSAGE	DIRECT DEVICE OFF FUNCTION: Enabled	*Range:* *Disabled, Enabled. Valid for units equipped with Direct Input/Output module.*
MESSAGE	REMOTE DEVICE OFF FUNCTION: Enabled	*Range:* *Disabled, Enabled. Valid for units that contain a CPU with Ethernet capability.*
MESSAGE	PRI. ETHERNET FAIL FUNCTION: Disabled	*Range:* *Disabled, Enabled. Valid for units that contain a CPU with a primary fiber port.*
MESSAGE	SEC. ETHERNET FAIL FUNCTION: Disabled	*Range:* *Disabled, Enabled. Valid for units that contain a CPU with a redundant fiber port.*
MESSAGE	BATTERY FAIL FUNCTION: Enabled	*Range:* *Disabled, Enabled.*
MESSAGE	SNTP FAIL FUNCTION: Enabled	*Range:* *Disabled, Enabled. Valid for units that contain a CPU with Ethernet capability.*
MESSAGE	IRIG-B FAIL FUNCTION: Enabled	*Range:* *Disabled, Enabled.*
MESSAGE	ETHERNET SWITCH FAIL FUNCTION: Disabled	*Range:* *Disabled, Enabled.*

All major self-test alarms are reported automatically with their corresponding FlexLogic™ operands, events, and targets. Most of the minor alarms can be disabled if desired.

When in the "Disabled" mode, minor alarms will not assert a FlexLogic™ operand, write to the event recorder, or display target messages. Moreover, they will not trigger the **ANY MINOR ALARM** or **ANY SELF-TEST** messages. When in the "Enabled" mode, minor alarms continue to function along with other major and minor alarms. Refer to the *Relay self-tests* section in chapter 7 for additional information on major and minor self-test alarms.

> **NOTE**
> To enable the Ethernet switch failure function, ensure that the **ETHERNET SWITCH FAIL FUNCTION** is "Enabled" in this menu.

5.2.13 CONTROL PUSHBUTTONS

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ ⇩ CONTROL PUSHBUTTONS ⇨ CONTROL PUSHBUTTON 1(7)

```
■ CONTROL
■ PUSHBUTTON 1
```
◀▶
```
CONTROL PUSHBUTTON 1
FUNCTION: Disabled
```
Range: Disabled, Enabled

MESSAGE ▲
```
CONTROL PUSHBUTTON 1
EVENTS: Disabled
```
Range: Disabled, Enabled
There are three standard control pushbuttons, labeled USER 1, USER 2, and USER 3, on the standard and enhanced front panels. These are user-programmable and can be used for various applications such as performing an LED test, switching setting groups, and invoking and scrolling though user-programmable displays.

Firmware revisions 3.2x and older use these three pushbuttons for manual breaker control. This functionality has been retained – if the breaker control feature is configured to use the three pushbuttons, they cannot be used as user-programmable control pushbuttons.The location of the control pushbuttons are shown in the following figures.

Control pushbuttons

842813A1.CDR

Figure 5–5: CONTROL PUSHBUTTONS (ENHANCED FACEPLATE)

An additional four control pushbuttons are included on the standard faceplate when the C60 is ordered with the twelve user-programmable pushbutton option.

842733A2.CDR
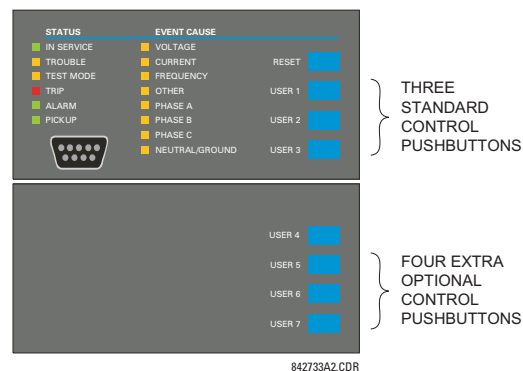

Figure 5–6: CONTROL PUSHBUTTONS (STANDARD FACEPLATE)

Control pushbuttons are not typically used for critical operations and are not protected by the control password. However, by supervising their output operands, the user can dynamically enable or disable control pushbuttons for security reasons.

Each control pushbutton asserts its own FlexLogic™ operand. These operands should be configured appropriately to perform the desired function. The operand remains asserted as long as the pushbutton is pressed and resets when the pushbutton is released. A dropout delay of 100 ms is incorporated to ensure fast pushbutton manipulation will be recognized by various features that may use control pushbuttons as inputs.

An event is logged in the event record (as per user setting) when a control pushbutton is pressed. No event is logged when the pushbutton is released. The faceplate keys (including control keys) cannot be operated simultaneously – a given key must be released before the next one can be pressed.

The control pushbuttons become user-programmable only if the breaker control feature is not configured for manual control via the USER 1 through 3 pushbuttons as shown below. If configured for manual control, breaker control typically uses the larger, optional user-programmable pushbuttons, making the control pushbuttons available for other user applications.
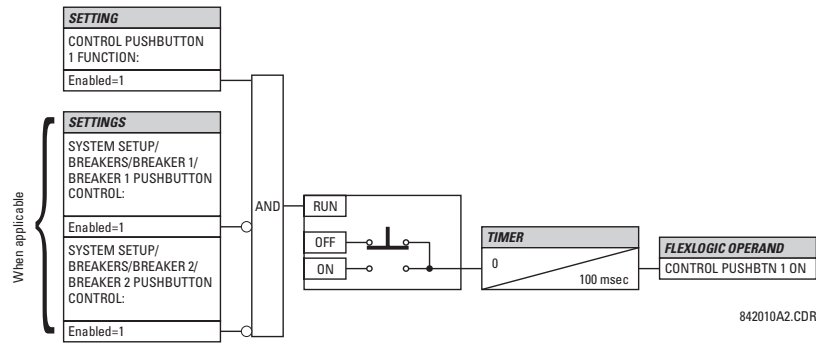

Figure 5–7: CONTROL PUSHBUTTON LOGIC

5.2.14 USER-PROGRAMMABLE PUSHBUTTONS

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ ⇩ USER-PROGRAMMABLE PUSHBUTTONS ⇨ USER PUSHBUTTON 1(16)

The optional user-programmable pushbuttons (specified in the order code) provide an easy and error-free method of enter-ing digital state (on, off) information. The number of available pushbuttons is dependent on the faceplate module ordered with the relay.

- Type P faceplate: standard horizontal faceplate with 12 user-programmable pushbuttons.

- Type Q faceplate: enhanced horizontal faceplate with 16 user-programmable pushbuttons.

The digital state can be entered locally (by directly pressing the front panel pushbutton) or remotely (via FlexLogic™ oper-ands) into FlexLogic™ equations, protection elements, and control elements. Typical applications include breaker control, autorecloser blocking, and setting groups changes. The user-programmable pushbuttons are under the control level of password protection.

The user-configurable pushbuttons for the enhanced faceplate are shown below.
Figure 5–8: USER-PROGRAMMABLE PUSHBUTTONS (ENHANCED FACEPLATE)

The user-configurable pushbuttons for the standard faceplate are shown below.
Figure 5–9: USER-PROGRAMMABLE PUSHBUTTONS (STANDARD FACEPLATE)

Both the standard and enhanced faceplate pushbuttons can be custom labeled with a factory-provided template, available online at http://www.GEmultilin.com. The EnerVista UR Setup software can also be used to create labels for the enhanced faceplate.

Each pushbutton asserts its own "On" and "Off" FlexLogic™ operands (for example, PUSHBUTTON 1 ON and PUSHBUTTON 1 OFF). These operands are available for each pushbutton and are used to program specific actions. If any pushbutton is active, the ANY PB ON operand will be asserted.

Each pushbutton has an associated LED indicator. By default, this indicator displays the present status of the correspond-ing pushbutton (on or off). However, each LED indicator can be assigned to any FlexLogic™ operand through the **PUSHBTN 1 LED CTL** setting.

The pushbuttons can be automatically controlled by activating the operands assigned to the **PUSHBTN 1 SET** (for latched and self-reset mode) and **PUSHBTN 1 RESET** (for latched mode only) settings. The pushbutton reset status is declared when the PUSHBUTTON 1 OFF operand is asserted. The activation and deactivation of user-programmable pushbuttons is dependent on whether latched or self-reset mode is programmed.

- *Latched mode*: In latched mode, a pushbutton can be set (activated) by asserting the operand assigned to the **PUSH-BTN 1 SET** setting or by directly pressing the associated front panel pushbutton. The pushbutton maintains the set state until deactivated by the reset command or after a user-specified time delay. The state of each pushbutton is stored in non-volatile memory and maintained through a loss of control power.

  The pushbutton is reset (deactivated) in latched mode by asserting the operand assigned to the **PUSHBTN 1 RESET** set-ting or by directly pressing the associated active front panel pushbutton.

It can also be programmed to reset automatically through the **PUSHBTN 1 AUTORST** and **PUSHBTN 1 AUTORST DELAY** settings. These settings enable the autoreset timer and specify the associated time delay. The autoreset timer can be used in select-before-operate (SBO) breaker control applications, where the command type (close/open) or breaker location (feeder number) must be selected prior to command execution. The selection must reset automatically if control is not executed within a specified time period.

- *Self-reset mode*: In self-reset mode, a pushbutton will remain active for the time it is pressed (the *pulse duration*) plus the dropout time specified in the **PUSHBTN 1 DROP-OUT TIME** setting. If the pushbutton is activated via FlexLogic™, the pulse duration is specified by the **PUSHBTN 1 DROP-OUT TIME** only. The time the operand remains assigned to the **PUSHBTN 1 SET** setting has no effect on the pulse duration.

  The pushbutton is reset (deactivated) in self-reset mode when the dropout delay specified in the **PUSHBTN 1 DROP-OUT TIME** setting expires.

> **NOTE**
>
> The pulse duration of the remote set, remote reset, or local pushbutton must be at least 50 ms to operate the pushbutton. This allows the user-programmable pushbuttons to properly operate during power cycling events and various system disturbances that may cause transient assertion of the operating signals.

The local and remote operation of each user-programmable pushbutton can be inhibited through the **PUSHBTN 1 LOCAL** and **PUSHBTN 1 REMOTE** settings, respectively. If local locking is applied, the pushbutton will ignore set and reset commands executed through the front panel pushbuttons. If remote locking is applied, the pushbutton will ignore set and reset commands executed through FlexLogic™ operands.

The locking functions are not applied to the autorestart feature. In this case, the inhibit function can be used in SBO control operations to prevent the pushbutton function from being activated and ensuring "one-at-a-time" select operation.

The locking functions can also be used to prevent the accidental pressing of the front panel pushbuttons. The separate inhibit of the local and remote operation simplifies the implementation of local/remote control supervision.

Pushbutton states can be logged by the event recorder and displayed as target messages. In latched mode, user-defined messages can also be associated with each pushbutton and displayed when the pushbutton is on or changing to off.

- **PUSHBUTTON 1 FUNCTION**: This setting selects the characteristic of the pushbutton. If set to "Disabled", the pushbutton is not active and the corresponding FlexLogic™ operands (both "On" and "Off") are de-asserted. If set to "Self-Reset", the control logic is activated by the pulse (longer than 100 ms) issued when the pushbutton is being physically pressed or virtually pressed via a FlexLogic™ operand assigned to the **PUSHBTN 1 SET** setting.

  When in "Self-Reset" mode and activated locally, the pushbutton control logic asserts the "On" corresponding FlexLogic™ operand as long as the pushbutton is being physically pressed, and after being released the deactivation of the operand is delayed by the drop out timer. The "Off" operand is asserted when the pushbutton element is deactivated. If the pushbutton is activated remotely, the control logic of the pushbutton asserts the corresponding "On" FlexLogic™ operand only for the time period specified by the **PUSHBTN 1 DROP-OUT TIME** setting.

  If set to "Latched", the control logic alternates the state of the corresponding FlexLogic™ operand between "On" and "Off" on each button press or by virtually activating the pushbutton (assigning set and reset operands). When in the "Latched" mode, the states of the FlexLogic™ operands are stored in a non-volatile memory. Should the power supply be lost, the correct state of the pushbutton is retained upon subsequent power up of the relay.

- **PUSHBTN 1 ID TEXT:** This setting specifies the top 20-character line of the user-programmable message and is intended to provide ID information of the pushbutton. Refer to the *User-definable displays* section for instructions on how to enter alphanumeric characters from the keypad.

- **PUSHBTN 1 ON TEXT:** This setting specifies the bottom 20-character line of the user-programmable message and is displayed when the pushbutton is in the "on" position. Refer to the *User-definable displays* section for instructions on entering alphanumeric characters from the keypad.

- **PUSHBTN 1 OFF TEXT:** This setting specifies the bottom 20-character line of the user-programmable message and is displayed when the pushbutton is activated from the on to the off position and the **PUSHBUTTON 1 FUNCTION** is "Latched". This message is not displayed when the **PUSHBUTTON 1 FUNCTION** is "Self-reset" as the pushbutton operand status is implied to be "Off" upon its release. The length of the "Off" message is configured with the **PRODUCT SETUP** ⇨⇩ **DISPLAY PROPERTIES** ⇨ **FLASH MESSAGE TIME** setting.

- **PUSHBTN 1 HOLD**: This setting specifies the time required for a pushbutton to be pressed before it is deemed active. This timer is reset upon release of the pushbutton. Note that any pushbutton operation will require the pushbutton to be pressed a minimum of 50 ms. This minimum time is required prior to activating the pushbutton hold timer.

- **PUSHBTN 1 SET**: This setting assigns the FlexLogic™ operand serving to operate the pushbutton element and to assert PUSHBUTTON 1 ON operand. The duration of the incoming set signal must be at least 100 ms.

- **PUSHBTN 1 RESET**: This setting assigns the FlexLogic™ operand serving to reset pushbutton element and to assert PUSHBUTTON 1 OFF operand. This setting is applicable only if pushbutton is in latched mode. The duration of the incoming reset signal must be at least 50 ms.

- **PUSHBTN 1 AUTORST**: This setting enables the user-programmable pushbutton autoreset feature. This setting is applicable only if the pushbutton is in the "Latched" mode.

- **PUSHBTN 1 AUTORST DELAY**: This setting specifies the time delay for automatic reset of the pushbutton when in the latched mode.

- **PUSHBTN 1 REMOTE**: This setting assigns the FlexLogic™ operand serving to inhibit pushbutton operation from the operand assigned to the **PUSHBTN 1 SET** or **PUSHBTN 1 RESET** settings.

- **PUSHBTN 1 LOCAL**: This setting assigns the FlexLogic™ operand serving to inhibit pushbutton operation from the front panel pushbuttons. This locking functionality is not applicable to pushbutton autoreset.

- **PUSHBTN 1 DROP-OUT TIME**: This setting applies only to "Self-Reset" mode and specifies the duration of the push-button active status after the pushbutton has been released. When activated remotely, this setting specifies the entire activation time of the pushbutton status; the length of time the operand remains on has no effect on the pulse duration. This setting is required to set the duration of the pushbutton operating pulse.

- **PUSHBTN 1 LED CTL**: This setting assigns the FlexLogic™ operand serving to drive pushbutton LED. If this setting is "Off", then LED operation is directly linked to PUSHBUTTON 1 ON operand.

- **PUSHBTN 1 MESSAGE**: If pushbutton message is set to "High Priority", the message programmed in the **PUSHBTN 1 ID** and **PUSHBTN 1 ON TEXT** settings will be displayed undisturbed as long as PUSHBUTTON 1 ON operand is asserted. The high priority option is not applicable to the **PUSHBTN 1 OFF TEXT** setting.

  This message can be temporary removed if any front panel keypad button is pressed. However, ten seconds of keypad inactivity will restore the message if the PUSHBUTTON 1 ON operand is still active.

  If the **PUSHBTN 1 MESSAGE** is set to "Normal", the message programmed in the **PUSHBTN 1 ID** and **PUSHBTN 1 ON TEXT** settings will be displayed as long as PUSHBUTTON 1 ON operand is asserted, but not longer than time period specified by **FLASH MESSAGE TIME** setting. After the flash time is expired, the default message or other active target message is displayed. The instantaneous reset of the flash message will be executed if any relay front panel button is pressed or any new target or message becomes active.

  The **PUSHBTN 1 OFF TEXT** setting is linked to PUSHBUTTON 1 OFF operand and will be displayed in conjunction with **PUSHBTN 1 ID** only if pushbutton element is in the "Latched" mode. The **PUSHBTN 1 OFF TEXT** message will be displayed as "Normal" if the **PUSHBTN 1 MESSAGE** setting is "High Priority" or "Normal".

- **PUSHBUTTON 1 EVENTS**: If this setting is enabled, each pushbutton state change will be logged as an event into event recorder.

The user-programmable pushbutton logic is shown below.
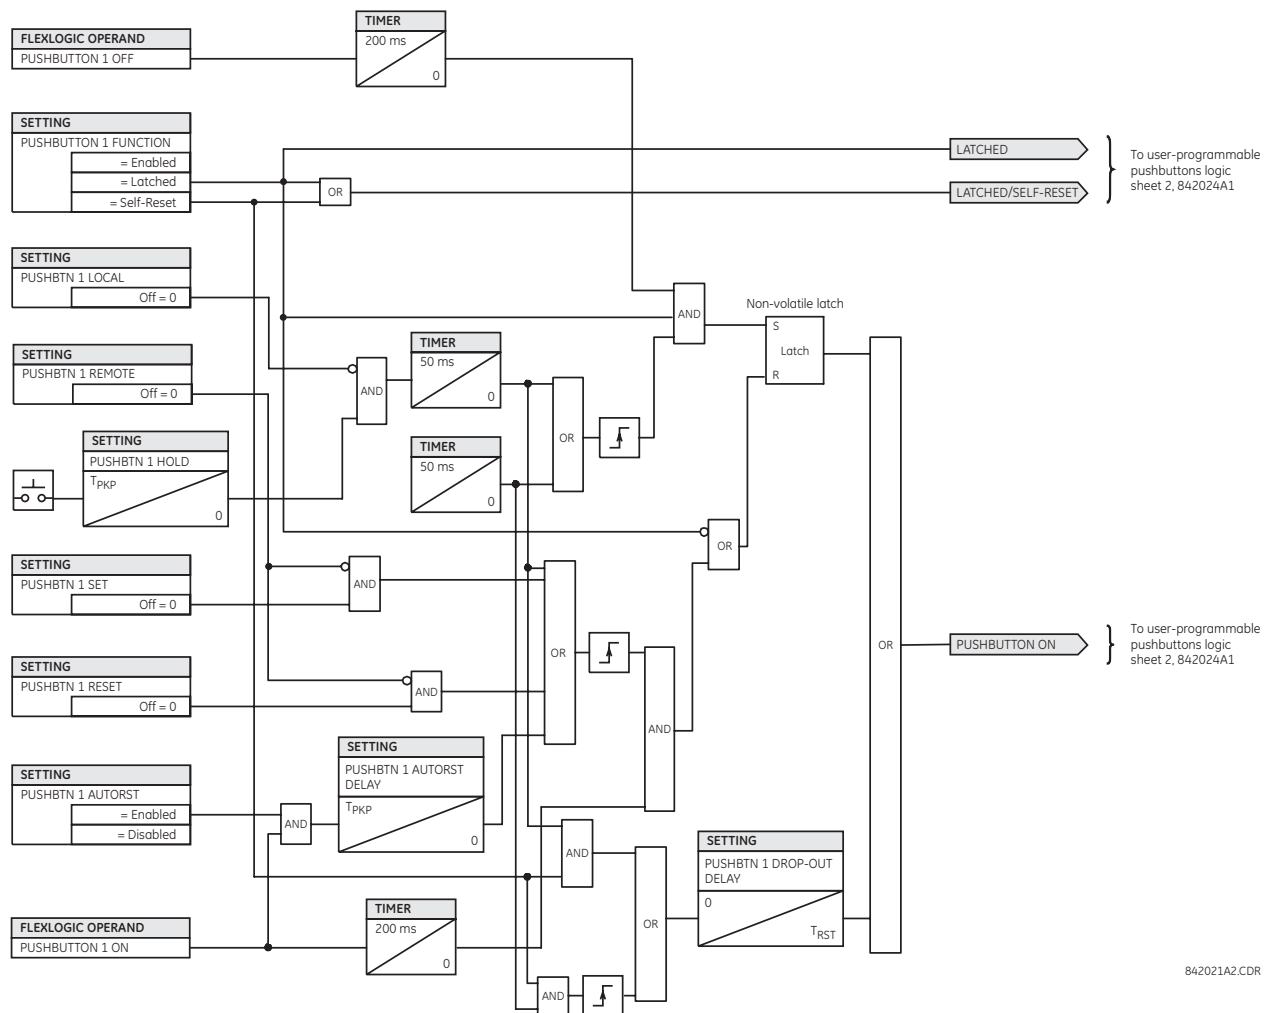

Figure 5–10: USER-PROGRAMMABLE PUSHBUTTON LOGIC (Sheet 1 of 2)
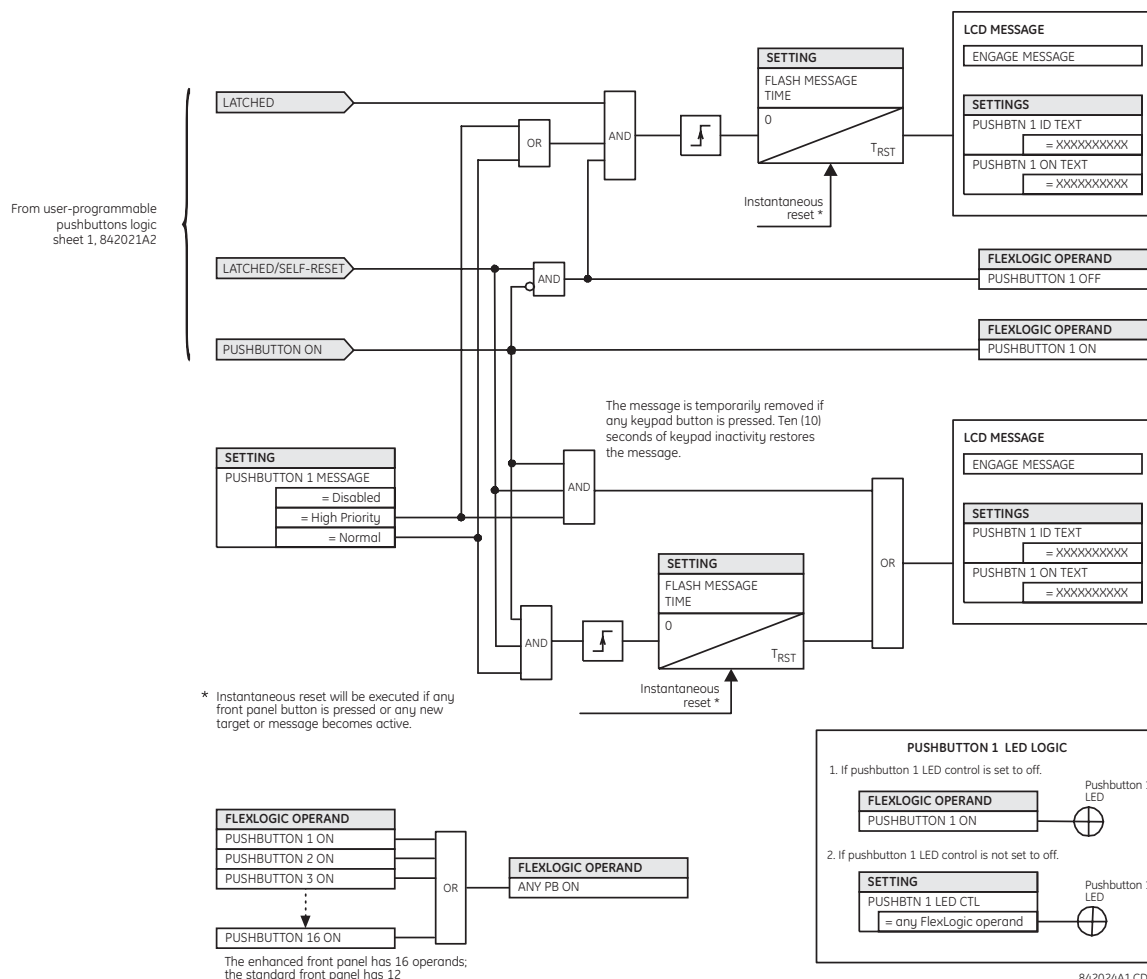

Figure 5–11: USER-PROGRAMMABLE PUSHBUTTON LOGIC (Sheet 2 of 2)

> **NOTE**
>
> User-programmable pushbuttons require a type HP or HQ faceplate. If an HP or HQ type faceplate was ordered separately, the relay order code must be changed to indicate the correct faceplate option. This can be done via EnerVista UR Setup with the **Maintenance > Enable Pushbutton** command.

5.2.15 FLEX STATE PARAMETERS

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨ ⇩ FLEX STATE PARAMETERS

```
■ FLEX STATE          ◄▶      PARAMETER   1:          Range: FlexLogic™ operand
■ PARAMETERS                  Off

                              PARAMETER   2:          Range: FlexLogic™ operand
              MESSAGE  ▲▼      Off

                                          ↓

                              PARAMETER 256:          Range: FlexLogic™ operand
              MESSAGE  ▲       Off
```
This feature provides a mechanism where any of 256 selected FlexLogic™ operand states can be used for efficient monitoring. The feature allows user-customized access to the FlexLogic™ operand states in the relay. The state bits are packed so that 16 states may be read out in a single Modbus register. The state bits can be configured so that all of the states which are of interest to the user are available in a minimum number of Modbus registers.

The state bits may be read out in the "Flex States" register array beginning at Modbus address 0900h. Sixteen states are packed into each register, with the lowest-numbered state in the lowest-order bit. There are sixteen registers to accommodate the 256 state bits.

a) MAIN MENU

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ USER-DEFINABLE DISPLAYS

```
■ USER-DEFINABLE        ◀▮▶    INVOKE AND SCROLL:        Range:  FlexLogic™ operand
■ DISPLAYS                      Off
```

```
              MESSAGE  ▲▼     ■ USER DISPLAY  1          Range:  up to 20 alphanumeric characters
                              ■
```

```
              MESSAGE  ▲▼     ■ USER DISPLAY  2          Range:  up to 20 alphanumeric characters
                              ■
```

↓

```
              MESSAGE  ▲      ■ USER DISPLAY 16          Range:  up to 20 alphanumeric characters
                              ■
```
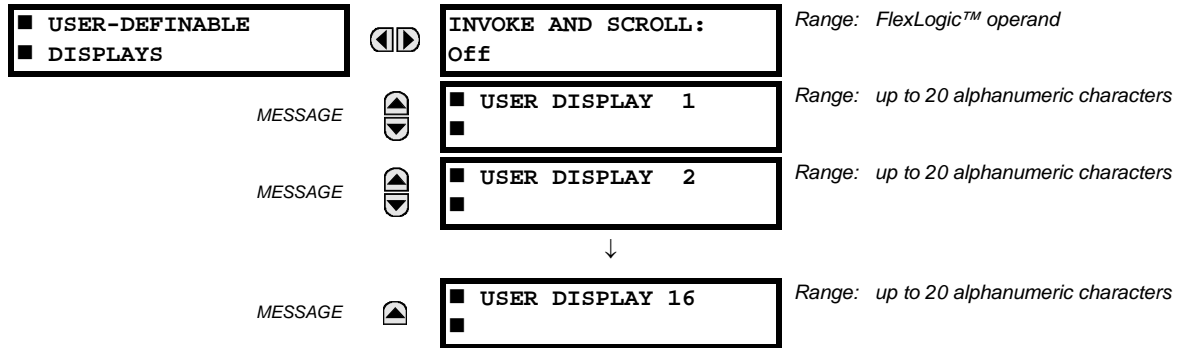

This menu provides a mechanism for manually creating up to 16 user-defined information displays in a convenient viewing sequence in the **USER DISPLAYS** menu (between the **TARGETS** and **ACTUAL VALUES** top-level menus). The sub-menus facilitate text entry and Modbus register data pointer options for defining the user display content.

Once programmed, the user-definable displays can be viewed in two ways.

- **KEYPAD**: Use the MENU key to select the **USER DISPLAYS** menu item to access the first user-definable display (note that only the programmed screens are displayed). The screens can be scrolled using the UP and DOWN keys. The display disappears after the default message time-out period specified by the **PRODUCT SETUP ⇨⇩ DISPLAY PROPERTIES ⇨⇩ DEFAULT MESSAGE TIMEOUT** setting.

- **USER-PROGRAMMABLE CONTROL INPUT**: The user-definable displays also respond to the **INVOKE AND SCROLL** setting. Any FlexLogic™ operand (in particular, the user-programmable pushbutton operands), can be used to navigate the programmed displays.

  On the rising edge of the configured operand (such as when the pushbutton is pressed), the displays are invoked by showing the last user-definable display shown during the previous activity. From this moment onward, the operand acts exactly as the down key and allows scrolling through the configured displays. The last display wraps up to the first one. The **INVOKE AND SCROLL** input and the DOWN key operate concurrently.

  When the default timer expires (set by the **DEFAULT MESSAGE TIMEOUT** setting), the relay will start to cycle through the user displays. The next activity of the **INVOKE AND SCROLL** input stops the cycling at the currently displayed user display, not at the first user-defined display. The **INVOKE AND SCROLL** pulses must last for at least 250 ms to take effect.

b) USER DISPLAY 1(16)

PATH: SETTINGS ⇨ **PRODUCT SETUP** ⇨⇩ **USER-DEFINABLE DISPLAYS** ⇨ **USER DISPLAY 1(16)**

■ USER DISPLAY 1 ■	◀▶	DISP 1 TOP LINE:	*Range: up to 20 alphanumeric characters*
	MESSAGE ▲▼	DISP 1 BOTTOM LINE:	*Range: up to 20 alphanumeric characters*
	MESSAGE ▲▼	DISP 1 ITEM 1 0	*Range: 0 to 65535 in steps of 1*
	MESSAGE ▲▼	DISP 1 ITEM 2 0	*Range: 0 to 65535 in steps of 1*
	MESSAGE ▲▼	DISP 1 ITEM 3 0	*Range: 0 to 65535 in steps of 1*
	MESSAGE ▲▼	DISP 1 ITEM 4 0	*Range: 0 to 65535 in steps of 1*
	MESSAGE ▲	DISP 1 ITEM 5: 0	*Range: 0 to 65535 in steps of 1*

Any existing system display can be automatically copied into an available user display by selecting the existing display and pressing the ENTER key. The display will then prompt **ADD TO USER DISPLAY LIST?**. After selecting "Yes", a message indicates that the selected display has been added to the user display list. When this type of entry occurs, the sub-menus are automatically configured with the proper content – this content may subsequently be edited.

This menu is used to enter user-defined text and user-selected Modbus-registered data fields into the particular user display. Each user display consists of two 20-character lines (top and bottom). The tilde (~) character is used to mark the start of a data field - the length of the data field needs to be accounted for. Up to five separate data fields can be entered in a user display - the *n*th tilde (~) refers to the *n*th item.

A User Display may be entered from the faceplate keypad or the EnerVista UR Setup interface (preferred for convenience). The following procedure shows how to enter text characters in the top and bottom lines from the faceplate keypad:

1. Select the line to be edited.

2. Press the decimal key to enter text edit mode.

3. Use either VALUE key to scroll through the characters. A space is selected like a character.

4. Press the decimal key to advance the cursor to the next position.

5. Repeat step 3 and continue entering characters until the desired text is displayed.

6. The HELP key may be pressed at any time for context sensitive help information.

7. Press the ENTER key to store the new settings.

To enter a numerical value for any of the five items (the *decimal form* of the selected Modbus address) from the faceplate keypad, use the number keypad. Use the value of '0' for any items not being used. Use the HELP key at any selected system display (setting, actual value, or command) which has a Modbus address, to view the *hexadecimal form* of the Modbus address, then manually convert it to decimal form before entering it (EnerVista UR Setup usage conveniently facilitates this conversion).

Use the MENU key to go to the user displays menu to view the user-defined content. The current user displays will show in sequence, changing every 4 seconds. While viewing a user display, press the ENTER key and then select the 'Yes" option to remove the display from the user display list. Use the MENU key again to exit the user displays menu.

An example user display setup and result is shown below:

∎ USER DISPLAY 1 ∎	◀▷		
MESSAGE ⬆⬇	DISP 1 TOP LINE: Current X ~ A		Shows user-defined text with first Tilde marker.
MESSAGE ⬆⬇	DISP 1 BOTTOM LINE: Current Y ~ A		Shows user-defined text with second Tilde marker.
MESSAGE ⬆⬇	DISP 1 ITEM 1: 6016		Shows decimal form of user-selected Modbus Register Address, corresponding to first Tilde marker.
MESSAGE ⬆⬇	DISP 1 ITEM 2: 6357		Shows decimal form of user-selected Modbus Register Address, corresponding to 2nd Tilde marker.
MESSAGE ⬆⬇	DISP 1 ITEM 3: 0		This item is not being used - there is no corresponding Tilde marker in Top or Bottom lines.
MESSAGE ⬆⬇	DISP 1 ITEM 4: 0		This item is not being used - there is no corresponding Tilde marker in Top or Bottom lines.
MESSAGE ⬆	DISP 1 ITEM 5: 0		This item is not being used - there is no corresponding Tilde marker in Top or Bottom lines.

USER DISPLAYS	→	Current X 0.850 A Current Y 0.327 A	Shows the resultant display content.

MESSAGE ⬆		∎ UNRETURNED ∎ MESSAGES ALARM CH2	**See page 5-62.**

Direct inputs and outputs are intended for exchange of status information (inputs and outputs) between UR-series relays connected directly via type 7 digital communications cards. The mechanism is very similar to IEC 61850 GSSE, except that communications takes place over a non-switchable isolated network and is optimized for speed. On type 7 cards that support two channels, direct output messages are sent from both channels simultaneously. This effectively sends direct output

messages both ways around a ring configuration. On type 7 cards that support one channel, direct output messages are sent only in one direction. Messages will be resent (forwarded) when it is determined that the message did not originate at the receiver.

Direct output message timing is similar to GSSE message timing. Integrity messages (with no state changes) are sent at least every 1000 ms. Messages with state changes are sent within the main pass scanning the inputs and asserting the outputs unless the communication channel bandwidth has been exceeded. Two self-tests are performed and signaled by the following FlexLogic™ operands:

1.   DIRECT RING BREAK (direct input/output ring break). This FlexLogic™ operand indicates that direct output messages sent from a UR-series relay are not being received back by the relay.

2.   DIRECT DEVICE 1 OFF to DIRECT DEVICE 16 OFF (direct device offline). These FlexLogic™ operands indicate that direct output messages from at least one direct device are not being received.

Direct input and output settings are similar to remote input and output settings. The equivalent of the remote device name strings for direct inputs and outputs is the **DIRECT OUTPUT DEVICE ID**. The **DIRECT OUTPUT DEVICE ID** setting identifies the relay in all direct output messages. All UR-series IEDs in a ring should have unique numbers assigned. The IED ID is used to identify the sender of the direct input and output message.

If the direct input and output scheme is configured to operate in a ring (**DIRECT I/O CH1 RING CONFIGURATION** or **DIRECT I/O CH2 RING CONFIGURATION** is "Yes"), all direct output messages should be received back. If not, the direct input/output ring break self-test is triggered. The self-test error is signaled by the DIRECT RING BREAK FlexLogic™ operand.

Select the **DIRECT I/O DATA RATE** to match the data capabilities of the communications channel. All IEDs communicating over direct inputs and outputs must be set to the same data rate. UR-series IEDs equipped with dual-channel communications cards apply the same data rate to both channels. Delivery time for direct input and output messages is approximately 0.2 of a power system cycle at 128 kbps and 0.4 of a power system cycle at 64 kbps, per each 'bridge'.

Table 5–4: DIRECT INPUT AND OUTPUT DATA RATES

MODULE	CHANNEL	SUPPORTED DATA RATES
74	Channel 1	64 kbps
	Channel 2	64 kbps

NOTE

The G.703 modules are fixed at 64 kbps. The **DIRECT I/O DATA RATE** setting is not applicable to these modules.

The **DIRECT I/O CHANNEL CROSSOVER** setting applies to C60s with dual-channel communication cards and allows crossing over messages from channel 1 to channel 2. This places all UR-series IEDs into one direct input and output network regardless of the physical media of the two communication channels.

The following application examples illustrate the basic concepts for direct input and output configuration. Please refer to the *Inputs and outputs* section in this chapter for information on configuring FlexLogic™ operands (flags, bits) to be exchanged.

Example 1: Extending the input/output capabilities of a UR-series relay

Consider an application that requires additional quantities of digital inputs or output contacts or lines of programmable logic that exceed the capabilities of a single UR-series chassis. The problem is solved by adding an extra UR-series IED, such as the C30, to satisfy the additional input and output and programmable logic requirements. The two IEDs are connected via single-channel digital communication cards as shown in the figure below.
Figure 5–12: INPUT AND OUTPUT EXTENSION VIA DIRECT INPUTS AND OUTPUTS

In the above application, the following settings should be applied. For UR-series IED 1:

> **DIRECT OUTPUT DEVICE ID:** "1"
> **DIRECT I/O CH1 RING CONFIGURATION:** "Yes"
> **DIRECT I/O DATA RATE:** "128 kbps"

For UR-series IED 2:

> **DIRECT OUTPUT DEVICE ID:** "2"
> **DIRECT I/O CH1 RING CONFIGURATION:** "Yes"
> **DIRECT I/O DATA RATE:** "128 kbps"

The message delivery time is about 0.2 of power cycle in both ways (at 128 kbps); that is, from device 1 to device 2, and from device 2 to device 1. Different communications cards can be selected by the user for this back-to-back connection (for example: fiber, G.703, or RS422).

Example 2: Interlocking busbar protection

A simple interlocking busbar protection scheme could be accomplished by sending a blocking signal from downstream devices, say 2, 3, and 4, to the upstream device that monitors a single incomer of the busbar, as shown below.
Figure 5–13: SAMPLE INTERLOCKING BUSBAR PROTECTION SCHEME

For increased reliability, a dual-ring configuration (shown below) is recommended for this application.
Figure 5–14: INTERLOCKING BUS PROTECTION SCHEME VIA DIRECT INPUTS/OUTPUTS

In the above application, the following settings should be applied. For UR-series IED 1:

DIRECT OUTPUT DEVICE ID: "1"
DIRECT I/O CH1 RING CONFIGURATION: "Yes"
DIRECT I/O CH2 RING CONFIGURATION: "Yes"

For UR-series IED 2:

DIRECT OUTPUT DEVICE ID: "1"
DIRECT I/O CH1 RING CONFIGURATION: "Yes"
DIRECT I/O CH2 RING CONFIGURATION: "Yes"

For UR-series IED 3:

DIRECT OUTPUT DEVICE ID: "1"
DIRECT I/O CH1 RING CONFIGURATION: "Yes"
DIRECT I/O CH2 RING CONFIGURATION: "Yes"

For UR-series IED 4:

DIRECT OUTPUT DEVICE ID: "1"
DIRECT I/O CH1 RING CONFIGURATION: "Yes"
DIRECT I/O CH2 RING CONFIGURATION: "Yes"

Message delivery time is approximately 0.2 of power system cycle (at 128 kbps) times number of 'bridges' between the origin and destination. Dual-ring configuration effectively reduces the maximum 'communications distance' by a factor of two.

In this configuration the following delivery times are expected (at 128 kbps) if both rings are healthy:

IED 1 to IED 2: 0.2 of power system cycle;
IED 1 to IED 3: 0.4 of power system cycle;
IED 1 to IED 4: 0.2 of power system cycle;
IED 2 to IED 3: 0.2 of power system cycle;
IED 2 to IED 4: 0.4 of power system cycle;
IED 3 to IED 4: 0.2 of power system cycle.

If one ring is broken (say TX2-RX2) the delivery times are as follows:

IED 1 to IED 2: 0.2 of power system cycle;
IED 1 to IED 3: 0.4 of power system cycle;
IED 1 to IED 4: 0.6 of power system cycle;
IED 2 to IED 3: 0.2 of power system cycle;
IED 2 to IED 4: 0.4 of power system cycle;
IED 3 to IED 4: 0.2 of power system cycle.

A coordinating timer for this bus protection scheme could be selected to cover the worst case scenario (0.4 of a power system cycle). Upon detecting a broken ring, the coordination time should be adaptively increased to 0.6 of a power system cycle. The complete application requires addressing a number of issues such as failure of both the communications rings, failure or out-of-service conditions of one of the relays, etc. Self-monitoring flags of the direct inputs and outputs feature would be primarily used to address these concerns.

Example 3: Pilot-Aided Schemes

Consider the three-terminal line protection application shown below:
Figure 5–15: THREE-TERMINAL LINE APPLICATION

A permissive pilot-aided scheme could be implemented in a two-ring configuration as shown below (IEDs 1 and 2 constitute a first ring, while IEDs 2 and 3 constitute a second ring):
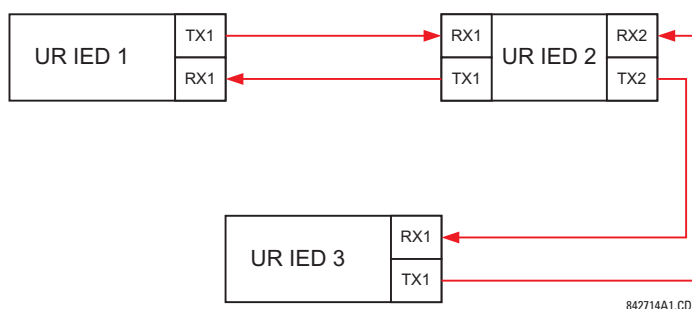

Figure 5–16: SINGLE-CHANNEL OPEN LOOP CONFIGURATION

In the above application, the following settings should be applied. For UR-series IED 1:

DIRECT OUTPUT DEVICE ID: "1"
DIRECT I/O CH1 RING CONFIGURATION: "Yes"
DIRECT I/O CH2 RING CONFIGURATION: "Yes"

For UR-series IED 2:

DIRECT OUTPUT DEVICE ID: "1"
DIRECT I/O CH1 RING CONFIGURATION: "Yes"
DIRECT I/O CH2 RING CONFIGURATION: "Yes"

For UR-series IED 3:

DIRECT OUTPUT DEVICE ID: "1"
DIRECT I/O CH1 RING CONFIGURATION: "Yes"
DIRECT I/O CH2 RING CONFIGURATION: "Yes"

In this configuration the following delivery times are expected (at 128 kbps):

IED 1 to IED 2: 0.2 of power system cycle;
IED 1 to IED 3: 0.5 of power system cycle;
IED 2 to IED 3: 0.2 of power system cycle.

In the above scheme, IEDs 1 and 3 do not communicate directly. IED 2 must be configured to forward the messages as explained in the *Inputs and outputs* section. A blocking pilot-aided scheme should be implemented with more security and, ideally, faster message delivery time. This could be accomplished using a dual-ring configuration as shown below.
Figure 5–17: DUAL-CHANNEL CLOSED LOOP (DUAL-RING) CONFIGURATION

In the above application, the following settings should be applied. For UR-series IED 1:

> **DIRECT OUTPUT DEVICE ID:** "1"
> **DIRECT I/O CH1 RING CONFIGURATION:** "Yes"
> **DIRECT I/O CH2 RING CONFIGURATION:** "Yes"

For UR-series IED 2:

> **DIRECT OUTPUT DEVICE ID:** "1"
> **DIRECT I/O CH1 RING CONFIGURATION:** "Yes"
> **DIRECT I/O CH2 RING CONFIGURATION:** "Yes"

For UR-series IED 3:

> **DIRECT OUTPUT DEVICE ID:** "1"
> **DIRECT I/O CH1 RING CONFIGURATION:** "Yes"
> **DIRECT I/O CH2 RING CONFIGURATION:** "Yes"

In this configuration the following delivery times are expected (at 128 kbps) if both the rings are healthy:

> IED 1 to IED 2: 0.2 of power system cycle;
> IED 1 to IED 3: 0.2 of power system cycle;
> IED 2 to IED 3: 0.2 of power system cycle.

The two communications configurations could be applied to both permissive and blocking schemes. Speed, reliability and cost should be taken into account when selecting the required architecture.

b) CRC ALARM CH1(2)

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ DIRECT I/O ⇨⇩ CRC ALARM CH1(2)

■ CRC ALARM CH1 ■	◀▮▶	CRC ALARM CH1 FUNCTION: Disabled	*Range: Enabled, Disabled*
MESSAGE	▲▼	CRC ALARM CH1 MESSAGE COUNT: 600	*Range: 100 to 10000 in steps of 1*
MESSAGE	▲▼	CRC ALARM CH1 THRESHOLD: 10	*Range: 1 to 1000 in steps of 1*
MESSAGE	▲	CRC ALARM CH1 EVENTS: Disabled	*Range: Enabled, Disabled*

The C60 checks integrity of the incoming direct input and output messages using a 32-bit CRC. The CRC alarm function is available for monitoring the communication medium noise by tracking the rate of messages failing the CRC check. The monitoring function counts all incoming messages, including messages that failed the CRC check. A separate counter adds up messages that failed the CRC check. When the failed CRC counter reaches the user-defined level specified by the **CRC ALARM CH1 THRESHOLD** setting within the user-defined message count **CRC ALARM 1 CH1 COUNT**, the DIR IO CH1 CRC ALARM FlexLogic™ operand is set.

When the total message counter reaches the user-defined maximum specified by the **CRC ALARM CH1 MESSAGE COUNT** setting, both the counters reset and the monitoring process is restarted.

The operand shall be configured to drive an output contact, user-programmable LED, or selected communication-based output. Latching and acknowledging conditions - if required - should be programmed accordingly.

The CRC alarm function is available on a per-channel basis. The total number of direct input and output messages that failed the CRC check is available as the **ACTUAL VALUES** ⇨ **STATUS** ⇨⇩ **DIRECT INPUTS** ⇨⇩ **CRC FAIL COUNT CH1** actual value.

- *Message count and length of the monitoring window*: To monitor communications integrity, the relay sends 1 message per second (at 64 kbps) or 2 messages per second (128 kbps) even if there is no change in the direct outputs. For example, setting the **CRC ALARM CH1 MESSAGE COUNT** to "10000", corresponds a time window of about 160 minutes at 64 kbps and 80 minutes at 128 kbps. If the messages are sent faster as a result of direct outputs activity, the monitoring time interval will shorten. This should be taken into account when determining the **CRC ALARM CH1 MESSAGE COUNT** setting. For example, if the requirement is a maximum monitoring time interval of 10 minutes at 64 kbps, then the **CRC ALARM CH1 MESSAGE COUNT** should be set to $10 \times 60 \times 1 = 600$.

- *Correlation of failed CRC and bit error rate (BER)*: The CRC check may fail if one or more bits in a packet are corrupted. Therefore, an exact correlation between the CRC fail rate and the BER is not possible. Under certain assumptions an approximation can be made as follows. A direct input and output packet containing 20 bytes results in 160 bits of data being sent and therefore, a transmission of 63 packets is equivalent to 10,000 bits. A BER of 10^{-4} implies 1 bit error for every 10000 bits sent or received. Assuming the best case of only 1 bit error in a failed packet, having 1 failed packet for every 63 received is about equal to a BER of 10^{-4}.

c) UNRETURNED MESSAGES ALARM CH1(2)

PATH: SETTINGS ⇨ **PRODUCT SETUP** ⇨⇩ **DIRECT I/O** ⇨⇩ **UNRETURNED MESSAGES ALARM CH1(2)**

■ UNRETURNED ■ MESSAGES ALARM CH1	UNRET MSGS ALARM CH1 FUNCTION: Disabled	*Range: Enabled, Disabled*
MESSAGE	UNRET MSGS ALARM CH1 MESSAGE COUNT: 600	*Range: 100 to 10000 in steps of 1*
MESSAGE	UNRET MSGS ALARM CH1 THRESHOLD: 10	*Range: 1 to 1000 in steps of 1*
MESSAGE	UNRET MSGS ALARM CH1 EVENTS: Disabled	*Range: Enabled, Disabled*

The C60 checks integrity of the direct input and output communication ring by counting unreturned messages. In the ring configuration, all messages originating at a given device should return within a pre-defined period of time. The unreturned messages alarm function is available for monitoring the integrity of the communication ring by tracking the rate of unreturned messages. This function counts all the outgoing messages and a separate counter adds the messages have failed to return. When the unreturned messages counter reaches the user-definable level specified by the **UNRET MSGS ALARM CH1 THRESHOLD** setting and within the user-defined message count **UNRET MSGS ALARM CH1 COUNT**, the DIR IO CH1 UNRET ALM FlexLogic™ operand is set.

When the total message counter reaches the user-defined maximum specified by the **UNRET MSGS ALARM CH1 MESSAGE COUNT** setting, both the counters reset and the monitoring process is restarted.

The operand shall be configured to drive an output contact, user-programmable LED, or selected communication-based output. Latching and acknowledging conditions, if required, should be programmed accordingly.

The unreturned messages alarm function is available on a per-channel basis and is active only in the ring configuration. The total number of unreturned input and output messages is available as the **ACTUAL VALUES** ⇨ **STATUS** ⇨⇩ **DIRECT INPUTS** ⇨⇩ **UNRETURNED MSG COUNT CH1** actual value.

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ TELEPROTECTION

■ TELEPROTECTION ■	TELEPROTECTION FUNCTION: Disabled	*Range: Disabled, Enabled*
MESSAGE	NUMBER OF TERMINALS: 2	*Range: 2, 3*
MESSAGE	NUMBER OF COMM CHANNELS: 1	*Range: 1, 2*
MESSAGE	LOCAL RELAY ID NUMBER: 0	*Range: 0 to 255 in steps of 1*
MESSAGE	TERMINAL 1 RELAY ID NUMBER: 0	*Range: 0 to 255 in steps of 1*
MESSAGE	TERMINAL 2 RELAY ID NUMBER: 0	*Range: 0 to 255 in steps of 1*

Digital teleprotection functionality is designed to transfer protection commands between two or three relays in a secure, fast, dependable, and deterministic fashion. Possible applications are permissive or blocking pilot schemes and direct transfer trip (DTT). Teleprotection can be applied over any analog or digital channels and any communications media, such as direct fiber, copper wires, optical networks, or microwave radio links. A mixture of communication media is possible.

Once teleprotection is enabled and the teleprotection input/outputs are configured, data packets are transmitted continuously every 1/4 cycle (3/8 cycle if using C37.94 modules) from peer-to-peer. Security of communication channel data is achieved by using CRC-32 on the data packet.

> **NOTE**
> Teleprotection inputs/outputs and direct inputs/outputs are mutually exclusive – as such, they cannot be used simulatneously. Once teleprotection inputs and outputs are enabled, direct inputs and outputs are blocked, and *vice versa*.

- **NUMBER OF TERMINALS**: Specifies whether the teleprotection system operates between two peers or three peers.

- **NUMBER OF CHANNELS**: Specifies how many channels are used. If the **NUMBER OF TERMINALS** is "3" (three-terminal system), set the **NUMBER OF CHANNELS** to "2". For a two-terminal system, the **NUMBER OF CHANNELS** can set to "1" or "2" (redundant channels).

- **LOCAL RELAY ID NUMBER**, **TERMINAL 1 RELAY ID NUMBER**, and **TERMINAL 2 RELAY ID NUMBER**: In installations that use multiplexers or modems, it is desirable to ensure that the data used by the relays protecting a given line is from the correct relays. The teleprotection function performs this check by reading the message ID sent by transmitting relays and comparing it to the programmed ID in the receiving relay. This check is also used to block inputs if inadvertently set to loopback mode or data is being received from a wrong relay by checking the ID on a received channel. If an incorrect ID is found on a channel during normal operation, the TELEPROT CH1 ID FAIL or TELEPROT CH2 ID FAIL FlexLogic™ operand is set, driving the event with the same name and blocking the teleprotection inputs. For commissioning purposes, the result of channel identification is also shown in the **STATUS ⇨⇩ CHANNEL TESTS ⇨⇩ VALIDITY OF CHANNEL CONFIGURATION** actual value. The default value of "0" for the **LOCAL RELAY ID NUMBER** indicates that relay ID is not to be checked. On two- terminals two-channel systems, the same **LOCAL RELAY ID NUMBER** is transmitted over both channels; as such, only the **TERMINAL 1 ID NUMBER** has to be programmed on the receiving end.

5.2.19 INSTALLATION

PATH: SETTINGS ⇨ PRODUCT SETUP ⇨⇩ INSTALLATION

■ INSTALLATION ■	RELAY SETTINGS: Not Programmed	*Range: Not Programmed, Programmed*
MESSAGE	RELAY NAME: Relay-1	*Range: up to 20 alphanumeric characters*

To safeguard against the installation of a relay without any entered settings, the unit will not allow signaling of any output relay until **RELAY SETTINGS** is set to "Programmed". This setting is defaulted to "Not Programmed" when at the factory. The **UNIT NOT PROGRAMMED** self-test error message is displayed until the relay is put into the "Programmed" state.

The **RELAY NAME** setting allows the user to uniquely identify a relay. This name will appear on generated reports. This name is also used to identify specific devices which are engaged in automatically sending/receiving data over the Ethernet communications channel using the IEC 61850 protocol.

5

a) CURRENT BANKS

PATH: SETTINGS ⇨⇩ SYSTEM SETUP ⇨ AC INPUTS ⇨ CURRENT BANK F1(M5)

```
■ CURRENT BANK F1                    PHASE CT F1            Range:  1 to 65000 A in steps of 1
■                                    PRIMARY:      1 A

                                     PHASE CT F1            Range:  1 A, 5 A
                 MESSAGE             SECONDARY: 1 A

                                     GROUND CT F1           Range:  1 to 65000 A in steps of 1
                 MESSAGE             PRIMARY:      1 A

                                     GROUND CT F1           Range:  1 A, 5 A
                 MESSAGE             SECONDARY: 1 A
```

> **NOTE**
>
> **Because energy parameters are accumulated, these values should be recorded and then reset immediately prior to changing CT characteristics.**

Four banks of phase and ground CTs can be set, where the current banks are denoted in the following format (*X* represents the module slot position letter):

> *Xa*, where *X* = {**F**, **M**} and *a* = {**1**, **5**}.

See the *Introduction to AC Sources* section at the beginning of this chapter for additional details.

These settings are critical for all features that have settings dependent on current measurements. When the relay is ordered, the CT module must be specified to include a standard or sensitive ground input. As the phase CTs are connected in wye (star), the calculated phasor sum of the three phase currents (IA + IB + IC = neutral current = 3Io) is used as the input for the neutral overcurrent elements. In addition, a zero-sequence (core balance) CT which senses current in all of the circuit primary conductors, or a CT in a neutral grounding conductor may also be used. For this configuration, the ground CT primary rating must be entered. To detect low level ground fault currents, the sensitive ground input may be used. In this case, the sensitive ground CT primary rating must be entered. Refer to chapter 3 for more details on CT connections.

Enter the rated CT primary current values. For both 1000:5 and 1000:1 CTs, the entry would be 1000. For correct operation, the CT secondary rating must match the setting (which must also correspond to the specific CT connections used).

The following example illustrates how multiple CT inputs (current banks) are summed as one source current. Given If the following current banks:

- F1: CT bank with 500:1 ratio.
- F5: CT bank with 1000: ratio.
- M1: CT bank with 800:1 ratio.

The following rule applies:

$$SRC\ 1\ =\ F1 + F5 + M1 \tag{EQ 5.7}$$

1 pu is the highest primary current. In this case, 1000 is entered and the secondary current from the 500:1 ratio CT will be adjusted to that created by a 1000:1 CT before summation. If a protection element is set up to act on SRC 1 currents, then a pickup level of 1 pu will operate on 1000 A primary.

The same rule applies for current sums from CTs with different secondary taps (5 A and 1 A).

b) VOLTAGE BANKS

PATH: SETTINGS ⇨⇩ SYSTEM SETUP ⇨ AC INPUTS ⇨⇩ VOLTAGE BANK F5(M5)

```
■ VOLTAGE BANK F5              ◄❚►      PHASE VT F5           │  Range:   Wye, Delta

                     MESSAGE   ▲        PHASE VT F5           │  Range:   1.00 to 24000.00 in steps of 0.01
                               ▼        RATIO: 1.00 :1        │

                     MESSAGE   ▲        AUXILIARY VT F5       │  Range:   Vn, Vag, Vbg, Vcg, Vab, Vbc, Vca
                               ▼        CONNECTION: Vag       │

                     MESSAGE   ▲        AUXILIARY VT F5       │  Range:   25.0 to 240.0 V in steps of 0.1
                               ▼        SECONDARY: 66.4 V     │

                     MESSAGE   ▲        AUXILIARY VT F5       │  Range:   1.00 to 24000.00 in steps of 0.01
                                        RATIO: 1.00 :1        │
```

> **CAUTION**
>
> **Because energy parameters are accumulated, these values should be recorded and then reset immediately prior to changing VT characteristics.**

Two banks of phase/auxiliary VTs can be set, where voltage banks are denoted in the following format (*X* represents the module slot position letter):

> *Xa*, where *X* = {**F**, **M**} and *a* = {**5**}.

See the *Introduction to AC sources* section at the beginning of this chapter for additional details.

With VTs installed, the relay can perform voltage measurements as well as power calculations. Enter the **PHASE VT F5 CONNECTION** made to the system as "Wye" or "Delta". An open-delta source VT connection would be entered as "Delta".

> **NOTE**
>
> The nominal **PHASE VT F5 SECONDARY** voltage setting is the voltage across the relay input terminals when nominal voltage is applied to the VT primary.
>
> For example, on a system with a 13.8 kV nominal primary voltage and with a 14400:120 volt VT in a delta connection, the secondary voltage would be 115; that is, (13800 / 14400) × 120. For a wye connection, the voltage value entered must be the phase to neutral voltage which would be $115 / \sqrt{3} = 66.4$.
>
> On a 14.4 kV system with a delta connection and a VT primary to secondary turns ratio of 14400:120, the voltage value entered would be 120; that is, 14400 / 120.

PATH: SETTINGS ⇨⇩ SYSTEM SETUP ⇨⇩ POWER SYSTEM

```
■ POWER SYSTEM          ◄▮►    NOMINAL FREQUENCY:        Range:  25 to 60 Hz in steps of 1
■                              60 Hz

              MESSAGE   ▲      PHASE ROTATION:           Range:  ABC, ACB
                        ▼      ABC

              MESSAGE   ▲      FREQUENCY AND PHASE       Range:  SRC 1, SRC 2, SRC 3, SRC 4
                        ▼      REFERENCE: SRC 1

              MESSAGE   ▲      FREQUENCY TRACKING:       Range:  Disabled, Enabled
                               Enabled
```

The power system **NOMINAL FREQUENCY** value is used as a default to set the digital sampling rate if the system frequency cannot be measured from available signals. This may happen if the signals are not present or are heavily distorted. Before reverting to the nominal frequency, the frequency tracking algorithm holds the last valid frequency measurement for a safe period of time while waiting for the signals to reappear or for the distortions to decay.

The phase sequence of the power system is required to properly calculate sequence components and power parameters. The **PHASE ROTATION** setting matches the power system phase sequence. Note that this setting informs the relay of the actual system phase sequence, either ABC or ACB. CT and VT inputs on the relay, labeled as A, B, and C, must be connected to system phases A, B, and C for correct operation.

The **FREQUENCY AND PHASE REFERENCE** setting determines which signal source is used (and hence which AC signal) for phase angle reference. The AC signal used is prioritized based on the AC inputs that are configured for the signal source: phase voltages takes precedence, followed by auxiliary voltage, then phase currents, and finally ground current.

For three phase selection, phase A is used for angle referencing ($V_{\text{ANGLE REF}} = V_A$), while Clarke transformation of the phase signals is used for frequency metering and tracking ($V_{\text{FREQUENCY}} = (2V_A - V_B - V_C)/3$) for better performance during fault, open pole, and VT and CT fail conditions.

The phase reference and frequency tracking AC signals are selected based upon the Source configuration, regardless of whether or not a particular signal is actually applied to the relay.

Phase angle of the reference signal will always display zero degrees and all other phase angles will be relative to this signal. If the pre-selected reference signal is not measurable at a given time, the phase angles are not referenced.

The phase angle referencing is done via a phase locked loop, which can synchronize independent UR-series relays if they have the same AC signal reference. These results in very precise correlation of time tagging in the event recorder between different UR-series relays provided the relays have an IRIG-B connection.

> **NOTE**
>
> **FREQUENCY TRACKING** should only be set to "Disabled" in very unusual circumstances; consult the factory for special variable-frequency applications.

5

Range: None, F1, F5, M1, M5
Only auxiliary voltage inputs will be displayed.

Identical menus are available for each source. The "SRC 1" text can be replaced by with a user-defined name appropriate for the associated source.

The first letter in the source identifier represents the module slot position. The number directly following this letter represents either the first bank of four channels (1, 2, 3, 4) called "1" or the second bank of four channels (5, 6, 7, 8) called "5" in a particular CT/VT module. Refer to the *Introduction to AC sources* section at the beginning of this chapter for additional details on this concept.

It is possible to select the sum of all CT combinations. The first channel displayed is the CT to which all others will be referred. For example, the selection "F1+F5" indicates the sum of each phase from channels "F1" and "F5", scaled to whichever CT has the higher ratio. Selecting "None" hides the associated actual values.

The approach used to configure the AC sources consists of several steps; first step is to specify the information about each CT and VT input. For CT inputs, this is the nominal primary and secondary current. For VTs, this is the connection type, ratio and nominal secondary voltage. Once the inputs have been specified, the configuration for each source is entered, including specifying which CTs will be summed together.

User selection of AC parameters for comparator elements:

CT/VT modules automatically calculate all current and voltage parameters from the available inputs. Users must select the specific input parameters to be measured by every element in the relevant settings menu. The internal design of the element specifies which type of parameter to use and provides a setting for source selection. In elements where the parameter may be either fundamental or RMS magnitude, such as phase time overcurrent, two settings are provided. One setting specifies the source, the second setting selects between fundamental phasor and RMS.

AC input actual values:

The calculated parameters associated with the configured voltage and current inputs are displayed in the current and voltage sections of actual values. Only the phasor quantities associated with the actual AC physical input channels will be displayed here. All parameters contained within a configured source are displayed in the sources section of the actual values.

Disturbance detectors (internal):

The disturbance detector (ANSI 50DD) element is a sensitive current disturbance detector that detects any disturbance on the protected system. The 50DD function is intended for use in conjunction with measuring elements, blocking of current based elements (to prevent maloperation as a result of the wrong settings), and starting oscillography data capture. A disturbance detector is provided for each source.

The 50DD function responds to the changes in magnitude of the sequence currents. The disturbance detector scheme logic is as follows:
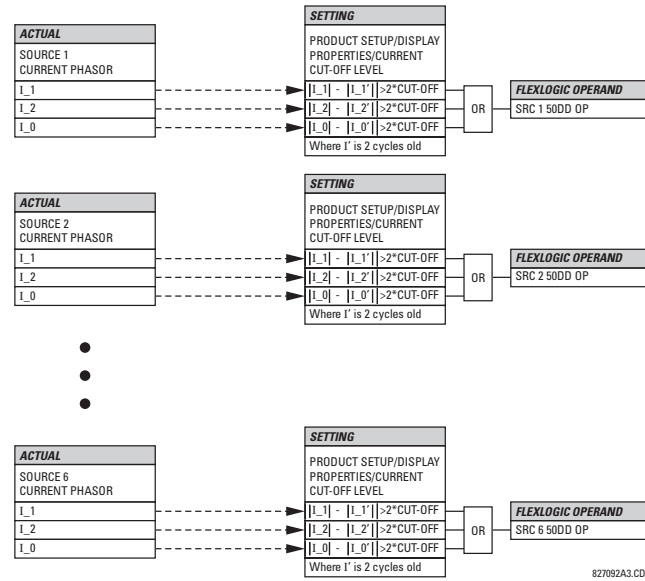

Figure 5–18: DISTURBANCE DETECTOR LOGIC DIAGRAM

The disturbance detector responds to the change in currents of twice the current cut-off level. The default cut-off threshold is 0.02 pu; thus by default the disturbance detector responds to a change of 0.04 pu. The metering sensitivity setting (**PROD-UCT SETUP ⇨⇩ DISPLAY PROPERTIES ⇨⇩ CURRENT CUT-OFF LEVEL**) controls the sensitivity of the disturbance detector accordingly.

Example use of sources:

An example of the use of sources is shown in the diagram below. A relay could have the following hardware configuration:

INCREASING SLOT POSITION LETTER -->		
CT/VT MODULE 1	**CT/VT MODULE 2**	**CT/VT MODULE 3**
CTs	VTs	not applicable

This configuration could be used on a two-winding transformer, with one winding connected into a breaker-and-a-half system. The following figure shows the arrangement of sources used to provide the functions required in this application, and the CT/VT inputs that are used to provide the data.
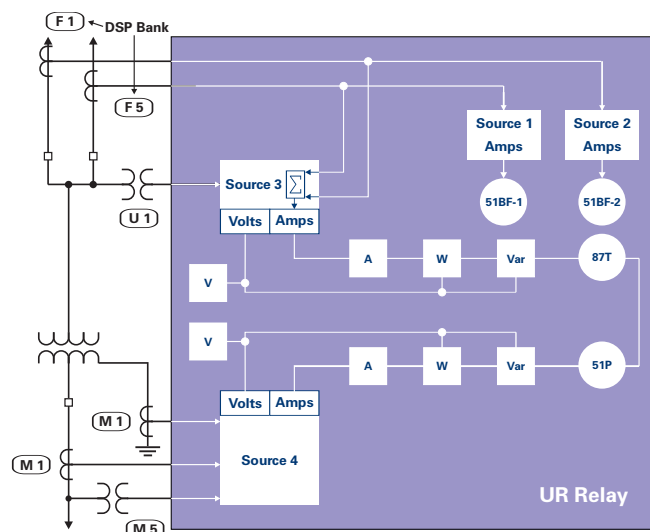

Figure 5–19: EXAMPLE USE OF SOURCES

5

A description of the operation of the breaker control and status monitoring features is provided in chapter 4. Only information concerning programming of the associated settings is covered here. These features are provided for two or more breakers; a user may use only those portions of the design relevant to a single breaker, which must be breaker 1.

The number of breaker control elements is dependent on the number of CT/VT modules specified with the C60. The following settings are available for each breaker control element.

- **BREAKER 1 FUNCTION:** This setting enables and disables the operation of the breaker control feature.

- **BREAKER1 PUSH BUTTON CONTROL:** Set to "Enable" to allow faceplate push button operations.

- **BREAKER 1 NAME:** Assign a user-defined name (up to six characters) to the breaker. This name will be used in flash messages related to breaker 1.

- **BREAKER 1 MODE:** This setting selects "3-pole" mode, where all breaker poles are operated simultaneously, or "1-pole" mode where all breaker poles are operated either independently or simultaneously.

- **BREAKER 1 OPEN:** This setting selects an operand that creates a programmable signal to operate an output relay to open breaker 1.

- **BREAKER 1 BLK OPEN**: This setting selects an operand that prevents opening of the breaker. This setting can be used for select-before-operate functionality or to block operation from a panel switch or from SCADA.

- **BREAKER 1 CLOSE:** This setting selects an operand that creates a programmable signal to operate an output relay to close breaker 1.

- **BREAKER 1 BLK CLOSE**: This setting selects an operand that prevents closing of the breaker. This setting can be used for select-before-operate functionality or to block operation from a panel switch or from SCADA.

- **BREAKER 1 ΦA/3P CLOSED:** This setting selects an operand, usually a contact input connected to a breaker auxiliary position tracking mechanism. This input should be a normally-open 52/a status input to create a logic 1 when the breaker is closed. If the **BREAKER 1 MODE** setting is selected as "3-Pole", this setting selects a single input as the operand used to track the breaker open or closed position. If the mode is selected as "1-Pole", the input mentioned above is used to track phase A and the **BREAKER 1 ΦB** and **BREAKER 1 ΦC** settings select operands to track phases B and C, respectively.

- **BREAKER 1 ΦA/3P OPND:** This setting selects an operand, usually a contact input, that should be a normally-closed 52/b status input to create a logic 1 when the breaker is open. If a separate 52/b contact input is not available, then the inverted BREAKER 1 CLOSED status signal can be used.

- **BREAKER 1 ΦB CLOSED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the breaker phase B closed position as above for phase A.

- **BREAKER 1 ΦB OPENED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the breaker phase B opened position as above for phase A.

- **BREAKER 1 ΦC CLOSED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the breaker phase C closed position as above for phase A.

- **BREAKER 1 ΦC OPENED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the breaker phase C opened position as above for phase A.

- **BREAKER 1 Toperate**: This setting specifies the required interval to overcome transient disagreement between the 52/a and 52/b auxiliary contacts during breaker operation. If transient disagreement still exists after this time has expired, the BREAKER 1 BAD STATUS FlexLogic™ operand is asserted from alarm or blocking purposes.

- **BREAKER 1 EXT ALARM:** This setting selects an operand, usually an external contact input, connected to a breaker alarm reporting contact.

- **BREAKER 1 ALARM DELAY:** This setting specifies the delay interval during which a disagreement of status among the three-pole position tracking operands will not declare a pole disagreement. This allows for non-simultaneous operation of the poles.

- **MANUAL CLOSE RECAL1 TIME:** This setting specifies the interval required to maintain setting changes in effect after an operator has initiated a manual close command to operate a circuit breaker.

- **BREAKER 1 OUT OF SV:** Selects an operand indicating that breaker 1 is out-of-service.

The disconnect switch element contains the auxiliary logic for status and serves as the interface for opening and closing of disconnect switches from SCADA or through the front panel interface. The disconnect switch element can be used to create an interlocking functionality. For greater security in determination of the switch pole position, both the 52/a and 52/b auxiliary contacts are used with reporting of the discrepancy between them. The number of available disconnect switches depends on the number of the CT/VT modules ordered with the C60.

- **SWITCH 1 FUNCTION:** This setting enables and disables the operation of the disconnect switch element.

- **SWITCH 1 NAME:** Assign a user-defined name (up to six characters) to the disconnect switch. This name will be used in flash messages related to disconnect switch 1.

- **SWITCH 1 MODE:** This setting selects "3-pole" mode, where all disconnect switch poles are operated simultaneously, or "1-pole" mode where all disconnect switch poles are operated either independently or simultaneously.

- **SWITCH 1 OPEN:** This setting selects an operand that creates a programmable signal to operate an output relay to open disconnect switch 1.

- **SWITCH 1 BLK OPEN**: This setting selects an operand that prevents opening of the disconnect switch. This setting can be used for select-before-operate functionality or to block operation from a panel switch or from SCADA.

- **SWITCH 1 CLOSE:** This setting selects an operand that creates a programmable signal to operate an output relay to close disconnect switch 1.

- **SWITCH 1 BLK CLOSE**: This setting selects an operand that prevents closing of the disconnect switch. This setting can be used for select-before-operate functionality or to block operation from a panel switch or from SCADA.

- **SWTCH 1 ΦA/3P CLSD:** This setting selects an operand, usually a contact input connected to a disconnect switch auxiliary position tracking mechanism. This input should be a normally-open 52/a status input to create a logic 1 when the disconnect switch is closed. If the **SWITCH 1 MODE** setting is selected as "3-Pole", this setting selects a single input as the operand used to track the disconnect switch open or closed position. If the mode is selected as "1-Pole", the input mentioned above is used to track phase A and the **SWITCH 1 ΦB** and **SWITCH 1 ΦC** settings select operands to track phases B and C, respectively.

- **SWITCH 1 ΦA/3P OPND:** This setting selects an operand, usually a contact input, that should be a normally-closed 52/b status input to create a logic 1 when the disconnect switch is open. If a separate 52/b contact input is not available, then the inverted SWITCH 1 CLOSED status signal can be used.

- **SWITCH 1 ΦB CLOSED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the disconnect switch phase B closed position as above for phase A.

- **SWITCH 1 ΦB OPENED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the disconnect switch phase B opened position as above for phase A.

- **SWITCH 1 ΦC CLOSED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the disconnect switch phase C closed position as above for phase A.

- **SWITCH 1 ΦC OPENED:** If the mode is selected as three-pole, this setting has no function. If the mode is selected as single-pole, this input is used to track the disconnect switch phase C opened position as above for phase A.

- **SWITCH 1 Toperate**: This setting specifies the required interval to overcome transient disagreement between the 52/a and 52/b auxiliary contacts during disconnect switch operation. If transient disagreement still exists after this time has expired, the SWITCH 1 BAD STATUS FlexLogic™ operand is asserted from alarm or blocking purposes.

- **SWITCH 1 ALARM DELAY:** This setting specifies the delay interval during which a disagreement of status among the three-pole position tracking operands will not declare a pole disagreement. This allows for non-simultaneous operation of the poles.

a) SETTINGS

PATH: SETTINGS ⇨⇩ SYSTEM SETUP ⇨⇩ FLEXCURVES ⇨ FLEXCURVE A(D)

```
■ FLEXCURVE A                          FLEXCURVE A TIME AT
■                          ◁1▷         0.00 xPKP:        0 ms
```

Range: 0 to 65535 ms in steps of 1

FlexCurves™ A through D have settings for entering times to reset and operate at the following pickup levels: 0.00 to 0.98 and 1.03 to 20.00. This data is converted into two continuous curves by linear interpolation between data points. To enter a custom FlexCurve™, enter the reset and operate times (using the VALUE keys) for each selected pickup point (using the MESSAGE UP/DOWN keys) for the desired protection curve (A, B, C, or D).

Table 5–5: FLEXCURVE™ TABLE

0.58		0.94		2.4		4.4		8.0		18.0	
0.60		0.95		2.5		4.5		8.5		18.5	
0.62		0.96		2.6		4.6		9.0		19.0	
0.64		0.97		2.7		4.7		9.5		19.5	
0.66		0.98		2.8		4.8		10.0		20.0	

> **NOTE**
> **The relay using a given FlexCurve™ applies linear approximation for times between the user-entered points. Special care must be applied when setting the two points that are close to the multiple of pickup of 1; that is, 0.98 pu and 1.03 pu. It is recommended to set the two times to a similar value; otherwise, the linear approximation may result in undesired behavior for the operating quantity that is close to 1.00 pu.**

b) FLEXCURVE™ CONFIGURATION WITH ENERVISTA UR SETUP

The EnerVista UR Setup software allows for easy configuration and management of FlexCurves™ and their associated data points. Prospective FlexCurves™ can be configured from a selection of standard curves to provide the best approximate fit, then specific data points can be edited afterwards. Alternately, curve data can be imported from a specified file (.csv format) by selecting the **Import Data From** EnerVista UR Setup setting.

Curves and data can be exported, viewed, and cleared by clicking the appropriate buttons. FlexCurves™ are customized by editing the operating time (ms) values at pre-defined per-unit current multiples. Note that the pickup multiples start at zero (implying the "reset time"), operating time below pickup, and operating time above pickup.

c) RECLOSER CURVE EDITING

Recloser curve selection is special in that recloser curves can be shaped into a composite curve with a minimum response time and a fixed time above a specified pickup multiples. There are 41 recloser curve types supported. These definite operating times are useful to coordinate operating times, typically at higher currents and where upstream and downstream protective devices have different operating characteristics. The recloser curve configuration window shown below appears when the Initialize From EnerVista UR Setup setting is set to "Recloser Curve" and the **Initialize FlexCurve** button is clicked.

Multiplier: Scales (multiplies) the curve operating times

Addr: Adds the time specified in this field (in ms) to each *curve* operating time value.

Minimum Response Time (MRT): If enabled, the MRT setting defines the shortest operating time even if the curve suggests a shorter time at higher current multiples. A composite operating characteristic is effectively defined. For current multiples lower than the intersection point, the curve dictates the operating time; otherwise, the MRT does. An information message appears when attempting to apply an MRT shorter than the minimum curve time.

High Current Time: Allows the user to set a pickup multiple from which point onwards the operating time is fixed. This is normally only required at higher current levels. The **HCT Ratio** defines the high current pickup multiple; the **HCT** defines the operating time.

842721A1.CDR

Figure 5–23: RECLOSER CURVE INITIALIZATION

NOTE

The multiplier and adder settings only affect the curve portion of the characteristic and not the MRT and HCT settings. The HCT settings override the MRT settings for multiples of pickup greater than the HCT ratio.

d) EXAMPLE

A composite curve can be created from the GE_111 standard with MRT = 200 ms and HCT initially disabled and then enabled at eight (8) times pickup with an operating time of 30 ms. At approximately four (4) times pickup, the curve operating time is equal to the MRT and from then onwards the operating time remains at 200 ms (see below).
Figure 5–24: COMPOSITE RECLOSER CURVE WITH HCT DISABLED

With the HCT feature enabled, the operating time reduces to 30 ms for pickup multiples exceeding 8 times pickup.
Figure 5–25: COMPOSITE RECLOSER CURVE WITH HCT ENABLED

NOTE

Configuring a composite curve with an increase in operating time at increased pickup multiples is not allowed. If this is attempted, the EnerVista UR Setup software generates an error message and discards the proposed changes.

e) STANDARD RECLOSER CURVES

The standard recloser curves available for the C60 are displayed in the following graphs.

5

To provide maximum flexibility to the user, the arrangement of internal digital logic combines fixed and user-programmed parameters. Logic upon which individual features are designed is fixed, and all other logic, from digital input signals through elements or combinations of elements to digital outputs, is variable. The user has complete control of all variable logic through FlexLogic™. In general, the system receives analog and digital inputs which it uses to produce analog and digital outputs. The major sub-systems of a generic UR-series relay involved in this process are shown below.
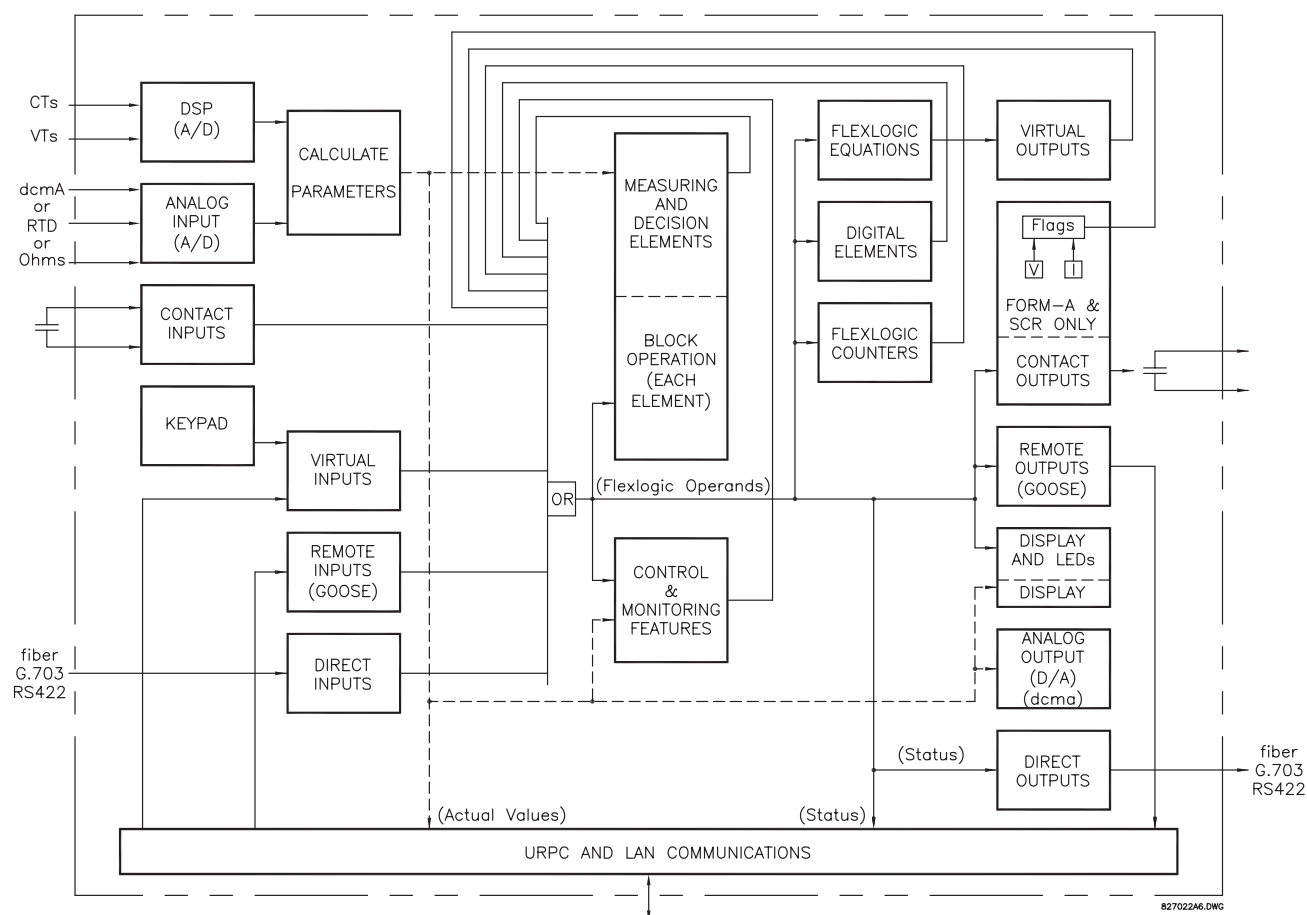

Figure 5–34: UR ARCHITECTURE OVERVIEW

The states of all digital signals used in the C60 are represented by flags (or FlexLogic™ operands, which are described later in this section). A digital "1" is represented by a 'set' flag. Any external contact change-of-state can be used to block an element from operating, as an input to a control feature in a FlexLogic™ equation, or to operate a contact output. The state of the contact input can be displayed locally or viewed remotely via the communications facilities provided. If a simple scheme where a contact input is used to block an element is desired, this selection is made when programming the element. This capability also applies to the other features that set flags: elements, virtual inputs, remote inputs, schemes, and human operators.

If more complex logic than presented above is required, it is implemented via FlexLogic™. For example, if it is desired to have the closed state of contact input H7a and the operated state of the phase undervoltage element block the operation of the phase time overcurrent element, the two control input states are programmed in a FlexLogic™ equation. This equation ANDs the two control inputs to produce a virtual output which is then selected when programming the phase time overcurrent to be used as a blocking input. Virtual outputs can only be created by FlexLogic™ equations.

Traditionally, protective relay logic has been relatively limited. Any unusual applications involving interlocks, blocking, or supervisory functions had to be hard-wired using contact inputs and outputs. FlexLogic™ minimizes the requirement for auxiliary components and wiring while making more complex schemes possible.

The logic that determines the interaction of inputs, elements, schemes and outputs is field programmable through the use of logic equations that are sequentially processed. The use of virtual inputs and outputs in addition to hardware is available internally and on the communication ports for other relays to use (distributed FlexLogic™).

FlexLogic™ allows users to customize the relay through a series of equations that consist of *operators* and *operands*. The operands are the states of inputs, elements, schemes and outputs. The operators are logic gates, timers and latches (with set and reset inputs). A system of sequential operations allows any combination of specified operands to be assigned as inputs to specified operators to create an output. The final output of an equation is a numbered register called a *virtual output*. Virtual outputs can be used as an input operand in any equation, including the equation that generates the output, as a seal-in or other type of feedback.

A FlexLogic™ equation consists of parameters that are either operands or operators. Operands have a logic state of 1 or 0. Operators provide a defined function, such as an AND gate or a Timer. Each equation defines the combinations of parameters to be used to set a Virtual Output flag. Evaluation of an equation results in either a 1 (=ON, i.e. flag set) or 0 (=OFF, i.e. flag not set). Each equation is evaluated at least 4 times every power system cycle.

Some types of operands are present in the relay in multiple instances; e.g. contact and remote inputs. These types of operands are grouped together (for presentation purposes only) on the faceplate display. The characteristics of the different types of operands are listed in the table below.

Table 5–6: C60 FLEXLOGIC™ OPERAND TYPES

OPERAND TYPE	STATE	EXAMPLE FORMAT	CHARACTERISTICS [INPUT IS '1' (= ON) IF...]
Contact Input	On	Cont Ip On	Voltage is presently applied to the input (external contact closed).
	Off	Cont Ip Off	Voltage is presently not applied to the input (external contact open).
Contact Output (type Form-A contact only)	Voltage On	Cont Op 1 VOn	Voltage exists across the contact.
	Voltage Off	Cont Op 1 VOff	Voltage does not exists across the contact.
	Current On	Cont Op 1 IOn	Current is flowing through the contact.
	Current Off	Cont Op 1 IOff	Current is not flowing through the contact.
Direct Input	On	DIRECT INPUT 1 On	The direct input is presently in the ON state.
Element (Analog)	Pickup	PHASE TOC1 PKP	The tested parameter is presently above the pickup setting of an element which responds to rising values or below the pickup setting of an element which responds to falling values.
	Dropout	PHASE TOC1 DPO	This operand is the logical inverse of the above PKP operand.
	Operate	PHASE TOC1 OP	The tested parameter has been above/below the pickup setting of the element for the programmed delay time, or has been at logic 1 and is now at logic 0 but the reset timer has not finished timing.
	Block	PHASE TOC1 BLK	The output of the comparator is set to the block function.
Element (Digital)	Pickup	Dig Element 1 PKP	The input operand is at logic 1.
	Dropout	Dig Element 1 DPO	This operand is the logical inverse of the above PKP operand.
	Operate	Dig Element 1 OP	The input operand has been at logic 1 for the programmed pickup delay time, or has been at logic 1 for this period and is now at logic 0 but the reset timer has not finished timing.
Element (Digital Counter)	Higher than	Counter 1 HI	The number of pulses counted is above the set number.
	Equal to	Counter 1 EQL	The number of pulses counted is equal to the set number.
	Lower than	Counter 1 LO	The number of pulses counted is below the set number.
Fixed	On	On	Logic 1
	Off	Off	Logic 0
Remote Input	On	REMOTE INPUT 1 On	The remote input is presently in the ON state.
Virtual Input	On	Virt Ip 1 On	The virtual input is presently in the ON state.
Virtual Output	On	Virt Op 1 On	The virtual output is presently in the set state (i.e. evaluation of the equation which produces this virtual output results in a "1").

The operands available for this relay are listed alphabetically by types in the following table.

Table 5–7: C60 FLEXLOGIC™ OPERANDS (Sheet 1 of 6)

OPERAND TYPE	OPERAND SYNTAX	OPERAND DESCRIPTION

UNAUTHORIZED ACCESS ALARM	UNAUTHORIZED ACCESS	Asserted when a password entry fails while accessing a password protected level of the relay.
USER-PROGRAMMABLE PUSHBUTTONS	PUSHBUTTON 1 ON PUSHBUTTON 1 OFF ANY PB ON	Pushbutton number 1 is in the "On" position Pushbutton number 1 is in the "Off" position Any of twelve pushbuttons is in the "On" position
	PUSHBUTTON 2 to 12	Same set of operands as PUSHBUTTON 1

Some operands can be re-named by the user. These are the names of the breakers in the breaker control feature, the ID (identification) of contact inputs, the ID of virtual inputs, and the ID of virtual outputs. If the user changes the default name or ID of any of these operands, the assigned name will appear in the relay list of operands. The default names are shown in the FlexLogic™ operands table above.

The characteristics of the logic gates are tabulated below, and the operators available in FlexLogic™ are listed in the Flex-Logic™ operators table.

Table 5–8: FLEXLOGIC™ GATE CHARACTERISTICS

GATES	NUMBER OF INPUTS	OUTPUT IS '1' (= ON) IF...
NOT	1	input is '0'
OR	2 to 16	any input is '1'
AND	2 to 16	all inputs are '1'
NOR	2 to 16	all inputs are '0'
NAND	2 to 16	any input is '0'
XOR	2	only one input is '1'

Table 5–9: FLEXLOGIC™ OPERATORS

TYPE	SYNTAX	DESCRIPTION	NOTES
Editor	INSERT	Insert a parameter in an equation list.	
	DELETE	Delete a parameter from an equation list.	
End	END	The first END encountered signifies the last entry in the list of processed FlexLogic™ parameters.	
One-shot	POSITIVE ONE SHOT	One shot that responds to a positive going edge.	A 'one shot' refers to a single input gate that generates a pulse in response to an edge on the input. The output from a 'one shot' is True (positive) for only one pass through the FlexLogic™ equation. There is a maximum of 64 'one shots'.
	NEGATIVE ONE SHOT	One shot that responds to a negative going edge.	
	DUAL ONE SHOT	One shot that responds to both the positive and negative going edges.	
Logic gate	NOT	Logical NOT	Operates on the previous parameter.
	OR(2) ↓ OR(16)	2 input OR gate ↓ 16 input OR gate	Operates on the 2 previous parameters. ↓ Operates on the 16 previous parameters.
	AND(2) ↓ AND(16)	2 input AND gate ↓ 16 input AND gate	Operates on the 2 previous parameters. ↓ Operates on the 16 previous parameters.
	NOR(2) ↓ NOR(16)	2 input NOR gate ↓ 16 input NOR gate	Operates on the 2 previous parameters. ↓ Operates on the 16 previous parameters.
	NAND(2) ↓ NAND(16)	2 input NAND gate ↓ 16 input NAND gate	Operates on the 2 previous parameters. ↓ Operates on the 16 previous parameters.
	XOR(2)	2 input Exclusive OR gate	Operates on the 2 previous parameters.
	LATCH (S,R)	Latch (set, reset): reset-dominant	The parameter preceding LATCH(S,R) is the reset input. The parameter preceding the reset input is the set input.
Timer	TIMER 1 ↓ TIMER 32	Timer set with FlexLogic™ timer 1 settings. ↓ Timer set with FlexLogic™ timer 32 settings.	The timer is started by the preceding parameter. The output of the timer is TIMER #.
Assign virtual output	= Virt Op 1 ↓ = Virt Op 96	Assigns previous FlexLogic™ operand to virtual output 1. ↓ Assigns previous FlexLogic™ operand to virtual output 96.	The virtual output is set by the preceding parameter

5.4.2 FLEXLOGIC™ RULES

When forming a FlexLogic™ equation, the sequence in the linear array of parameters must follow these general rules:

1. Operands must precede the operator which uses the operands as inputs.

2. Operators have only one output. The output of an operator must be used to create a virtual output if it is to be used as an input to two or more operators.

3. Assigning the output of an operator to a virtual output terminates the equation.

4. A timer operator (for example, "TIMER 1") or virtual output assignment (for example, " = Virt Op 1") may only be used once. If this rule is broken, a syntax error will be declared.

5.4.3 FLEXLOGIC™ EVALUATION

Each equation is evaluated in the order in which the parameters have been entered.

NOTE

FlexLogic™ provides latches which by definition have a memory action, remaining in the set state after the set input has been asserted. However, they are *volatile*; that is, they reset on the re-application of control power.

When making changes to settings, all FlexLogic™ equations are re-compiled whenever any new setting value is entered, so all latches are automatically reset. If it is necessary to re-initialize FlexLogic™ during testing, for example, it is suggested to power the unit down and then back up.

This section provides an example of implementing logic for a typical application. The sequence of the steps is quite important as it should minimize the work necessary to develop the relay settings. Note that the example presented in the figure below is intended to demonstrate the procedure, not to solve a specific application situation.

In the example below, it is assumed that logic has already been programmed to produce virtual outputs 1 and 2, and is only a part of the full set of equations used. When using FlexLogic™, it is important to make a note of each virtual output used – a virtual output designation (1 to 96) can only be properly assigned once.
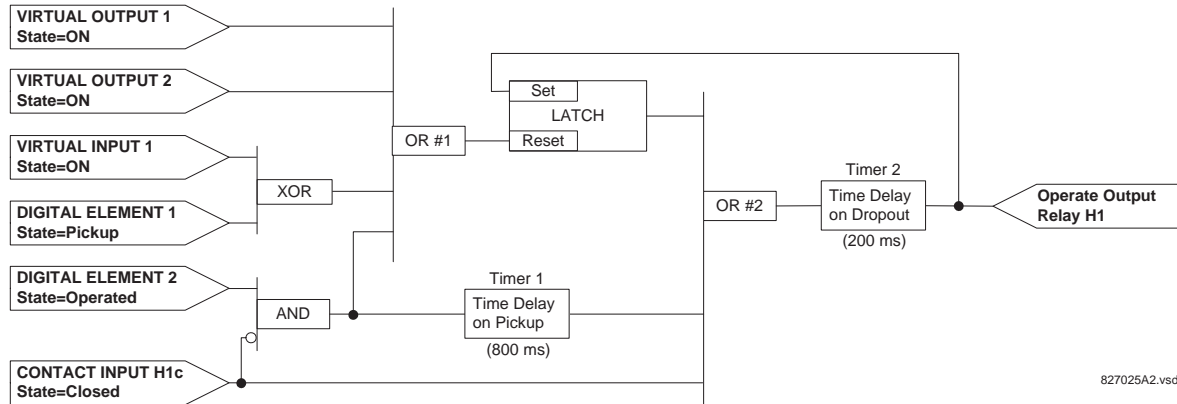

Figure 5–35: EXAMPLE LOGIC SCHEME

1. Inspect the example logic diagram to determine if the required logic can be implemented with the FlexLogic™ operators. If this is not possible, the logic must be altered until this condition is satisfied. Once this is done, count the inputs to each gate to verify that the number of inputs does not exceed the FlexLogic™ limits, which is unlikely but possible. If the number of inputs is too high, subdivide the inputs into multiple gates to produce an equivalent. For example, if 25 inputs to an AND gate are required, connect Inputs 1 through 16 to AND(16), 17 through 25 to AND(9), and the outputs from these two gates to AND(2).

   Inspect each operator between the initial operands and final virtual outputs to determine if the output from the operator is used as an input to more than one following operator. If so, the operator output must be assigned as a virtual output.

   For the example shown above, the output of the AND gate is used as an input to both OR#1 and Timer 1, and must therefore be made a virtual output and assigned the next available number (i.e. Virtual Output 3). The final output must also be assigned to a virtual output as virtual output 4, which will be programmed in the contact output section to operate relay H1 (that is, contact output H1).

   Therefore, the required logic can be implemented with two FlexLogic™ equations with outputs of virtual output 3 and virtual output 4 as shown below.
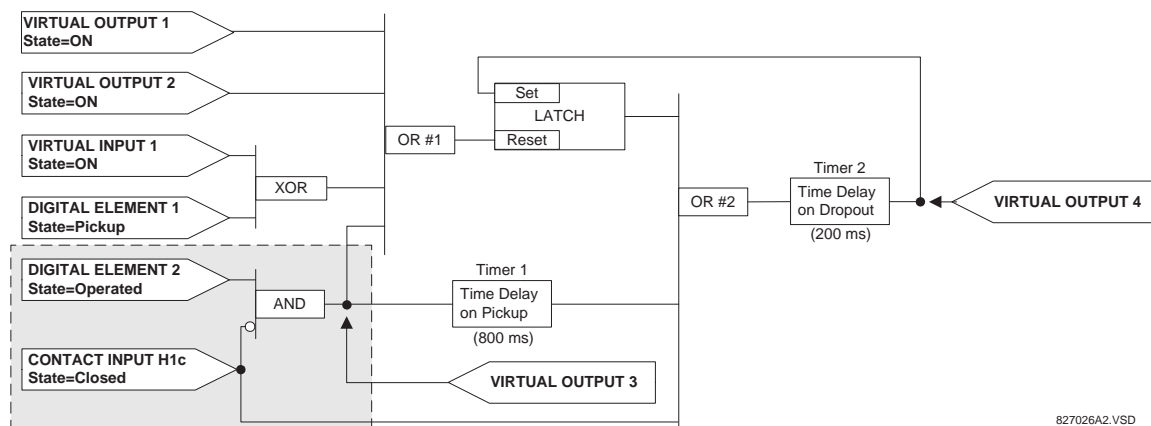

Figure 5–36: LOGIC EXAMPLE WITH VIRTUAL OUTPUTS

2. Prepare a logic diagram for the equation to produce virtual output 3, as this output will be used as an operand in the virtual output 4 equation (create the equation for every output that will be used as an operand first, so that when these operands are required they will already have been evaluated and assigned to a specific virtual output). The logic for virtual output 3 is shown below with the final output assigned.
Figure 5–37: LOGIC FOR VIRTUAL OUTPUT 3

3. Prepare a logic diagram for virtual output 4, replacing the logic ahead of virtual output 3 with a symbol identified as virtual output 3, as shown below.
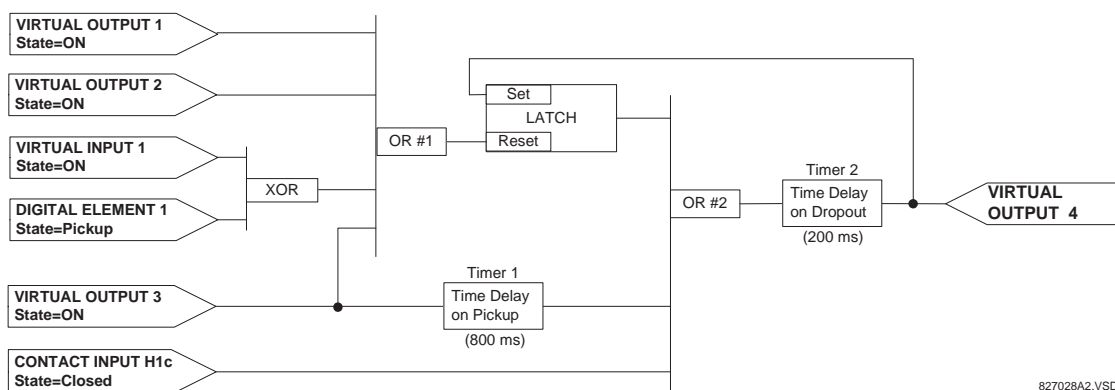

Figure 5–38: LOGIC FOR VIRTUAL OUTPUT 4

4. Program the FlexLogic™ equation for virtual output 3 by translating the logic into available FlexLogic™ parameters. The equation is formed one parameter at a time until the required logic is complete. It is generally easier to start at the output end of the equation and work back towards the input, as shown in the following steps. It is also recommended to list operator inputs from bottom to top. For demonstration, the final output will be arbitrarily identified as parameter 99, and each preceding parameter decremented by one in turn. Until accustomed to using FlexLogic™, it is suggested that a worksheet with a series of cells marked with the arbitrary parameter numbers be prepared, as shown below.

Figure 5–39: FLEXLOGIC™ WORKSHEET

5. Following the procedure outlined, start with parameter 99, as follows:

     99: The final output of the equation is virtual output 3, which is created by the operator "= Virt Op n". This parameter is therefore "= Virt Op 3."

98: The gate preceding the output is an AND, which in this case requires two inputs. The operator for this gate is a 2-input AND so the parameter is "AND(2)". Note that FlexLogic™ rules require that the number of inputs to most types of operators must be specified to identify the operands for the gate. As the 2-input AND will operate on the two operands preceding it, these inputs must be specified, starting with the lower.

97: This lower input to the AND gate must be passed through an inverter (the NOT operator) so the next parameter is "NOT". The NOT operator acts upon the operand immediately preceding it, so specify the inverter input next.

96: The input to the NOT gate is to be contact input H1c. The ON state of a contact input can be programmed to be set when the contact is either open or closed. Assume for this example the state is to be ON for a closed contact. The operand is therefore "Cont Ip H1c On".

95: The last step in the procedure is to specify the upper input to the AND gate, the operated state of digital element 2. This operand is "DIG ELEM 2 OP".

Writing the parameters in numerical order can now form the equation for virtual output 3:

```
[95] DIG ELEM 2 OP
[96] Cont Ip H1c On
[97] NOT
[98] AND(2)
[99] = Virt Op 3
```

It is now possible to check that this selection of parameters will produce the required logic by converting the set of parameters into a logic diagram. The result of this process is shown below, which is compared to the logic for virtual output 3 diagram as a check.
Figure 5–40: FLEXLOGIC™ EQUATION FOR VIRTUAL OUTPUT 3

6. Repeating the process described for virtual output 3, select the FlexLogic™ parameters for Virtual Output 4.

99: The final output of the equation is virtual output 4 which is parameter "= Virt Op 4".

98: The operator preceding the output is timer 2, which is operand "TIMER 2". Note that the settings required for the timer are established in the timer programming section.

97: The operator preceding timer 2 is OR #2, a 3-input OR, which is parameter "OR(3)".

96: The lowest input to OR #2 is operand "Cont Ip H1c On".

95: The center input to OR #2 is operand "TIMER 1".

94: The input to timer 1 is operand "Virt Op 3 On".

93: The upper input to OR #2 is operand "LATCH (S,R)".

92: There are two inputs to a latch, and the input immediately preceding the latch reset is OR #1, a 4-input OR, which is parameter "OR(4)".

91: The lowest input to OR #1 is operand "Virt Op 3 On".

90: The input just above the lowest input to OR #1 is operand "XOR(2)".

89: The lower input to the XOR is operand "DIG ELEM 1 PKP".

88: The upper input to the XOR is operand "Virt Ip 1 On".

87: The input just below the upper input to OR #1 is operand "Virt Op 2 On".

86: The upper input to OR #1 is operand "Virt Op 1 On".

85: The last parameter is used to set the latch, and is operand "Virt Op 4 On".

The equation for virtual output 4 is:

```
[85] Virt Op 4 On
[86] Virt Op 1 On
[87] Virt Op 2 On
[88] Virt Ip 1 On
[89] DIG ELEM 1 PKP
[90] XOR(2)
[91] Virt Op 3 On
[92] OR(4)
[93] LATCH (S,R)
[94] Virt Op 3 On
[95] TIMER 1
[96] Cont Ip H1c On
[97] OR(3)
[98] TIMER 2
[99] = Virt Op 4
```

It is now possible to check that the selection of parameters will produce the required logic by converting the set of parameters into a logic diagram. The result of this process is shown below, which is compared to the logic for virtual output 4 diagram as a check.
Figure 5–41: FLEXLOGIC™ EQUATION FOR VIRTUAL OUTPUT 4

7. Now write the complete FlexLogic™ expression required to implement the logic, making an effort to assemble the equation in an order where Virtual Outputs that will be used as inputs to operators are created before needed. In cases where a lot of processing is required to perform logic, this may be difficult to achieve, but in most cases will not cause problems as all logic is calculated at least four times per power frequency cycle. The possibility of a problem caused by sequential processing emphasizes the necessity to test the performance of FlexLogic™ before it is placed in service.

In the following equation, virtual output 3 is used as an input to both latch 1 and timer 1 as arranged in the order shown below:

```
DIG ELEM 2 OP
Cont Ip H1c On
NOT
AND(2)
```

```
= Virt Op 3
Virt Op 4 On
Virt Op 1 On
Virt Op 2 On
Virt Ip 1 On
DIG ELEM 1 PKP
XOR(2)
Virt Op 3 On
OR(4)
LATCH (S,R)
Virt Op 3 On
TIMER 1
Cont Ip H1c On
OR(3)
TIMER 2
= Virt Op 4
END
```

In the expression above, the virtual output 4 input to the four-input OR is listed before it is created. This is typical of a form of feedback, in this case, used to create a seal-in effect with the latch, and is correct.

8.   The logic should always be tested after it is loaded into the relay, in the same fashion as has been used in the past. Testing can be simplified by placing an "END" operator within the overall set of FlexLogic™ equations. The equations will then only be evaluated up to the first "END" operator.

The "On" and "Off" operands can be placed in an equation to establish a known set of conditions for test purposes, and the "INSERT" and "DELETE" commands can be used to modify equations.

5.4.5 FLEXLOGIC™ EQUATION EDITOR

5

A FlexElement™ is a universal comparator that can be used to monitor any analog actual value calculated by the relay or a net difference of any two analog actual values of the same type. The effective operating signal could be treated as a signed number or its absolute value could be used as per user's choice.

The element can be programmed to respond either to a signal level or to a rate-of-change (delta) over a pre-defined period of time. The output operand is asserted when the operating signal is higher than a threshold or lower than a threshold as per user's choice.
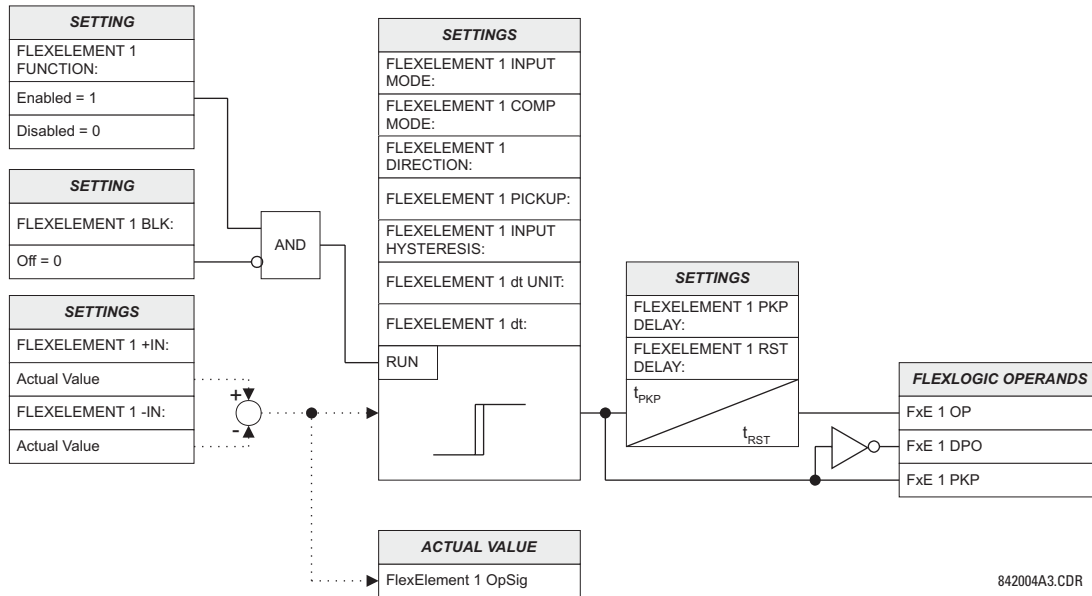

Figure 5–42: FLEXELEMENT™ SCHEME LOGIC

The **FLEXELEMENT 1 +IN** setting specifies the first (non-inverted) input to the FlexElement™. Zero is assumed as the input if this setting is set to "Off". For proper operation of the element at least one input must be selected. Otherwise, the element will not assert its output operands.

This **FLEXELEMENT 1 –IN** setting specifies the second (inverted) input to the FlexElement™. Zero is assumed as the input if this setting is set to "Off". For proper operation of the element at least one input must be selected. Otherwise, the element will not assert its output operands. This input should be used to invert the signal if needed for convenience, or to make the element respond to a differential signal such as for a top-bottom oil temperature differential alarm. The element will not operate if the two input signals are of different types, for example if one tries to use active power and phase angle to build the effective operating signal.

The element responds directly to the differential signal if the **FLEXELEMENT 1 INPUT MODE** setting is set to "Signed". The element responds to the absolute value of the differential signal if this setting is set to "Absolute". Sample applications for the "Absolute" setting include monitoring the angular difference between two phasors with a symmetrical limit angle in both directions; monitoring power regardless of its direction, or monitoring a trend regardless of whether the signal increases of decreases.

The element responds directly to its operating signal – as defined by the **FLEXELEMENT 1 +IN**, **FLEXELEMENT 1 –IN** and **FLEXELEMENT 1 INPUT MODE** settings – if the **FLEXELEMENT 1 COMP MODE** setting is set to "Level". The element responds to the rate of change of its operating signal if the **FLEXELEMENT 1 COMP MODE** setting is set to "Delta". In this case the **FLEXELEMENT 1 dt UNIT** and **FLEXELEMENT 1 dt** settings specify how the rate of change is derived.

The **FLEXELEMENT 1 DIRECTION** setting enables the relay to respond to either high or low values of the operating signal. The following figure explains the application of the **FLEXELEMENT 1 DIRECTION**, **FLEXELEMENT 1 PICKUP** and **FLEXELEMENT 1 HYSTERESIS** settings.
Figure 5–43: FLEXELEMENT™ DIRECTION, PICKUP, AND HYSTERESIS

In conjunction with the **FLEXELEMENT 1 INPUT MODE** setting the element could be programmed to provide two extra characteristics as shown in the figure below.
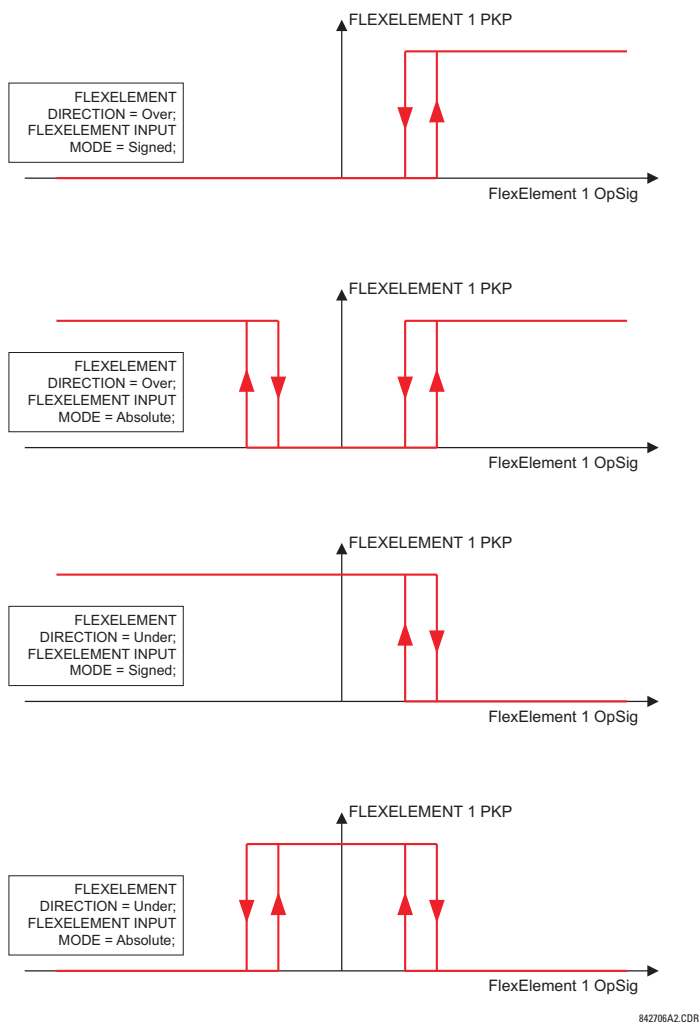

Figure 5–44: FLEXELEMENT™ INPUT MODE SETTING

The **FLEXELEMENT 1 PICKUP** setting specifies the operating threshold for the effective operating signal of the element. If set to "Over", the element picks up when the operating signal exceeds the **FLEXELEMENT 1 PICKUP** value. If set to "Under", the element picks up when the operating signal falls below the **FLEXELEMENT 1 PICKUP** value.

The **FLEXELEMENT 1 HYSTERESIS** setting controls the element dropout. It should be noticed that both the operating signal and the pickup threshold can be negative facilitating applications such as reverse power alarm protection. The FlexElement™ can be programmed to work with all analog actual values measured by the relay. The **FLEXELEMENT 1 PICKUP** setting is entered in per-unit values using the following definitions of the base units:

Table 5–10: FLEXELEMENT™ BASE UNITS

BREAKER ARCING AMPS (Brk X Arc Amp A, B, and C)	BASE = 2000 kA^2 × cycle
dcmA	BASE = maximum value of the **DCMA INPUT MAX** setting for the two transducers configured under the +IN and –IN inputs.
FREQUENCY	f_{BASE} = 1 Hz
PHASE ANGLE	φ_{BASE} = 360 degrees (see the UR angle referencing convention)
POWER FACTOR	PF_{BASE} = 1.00
RTDs	BASE = 100°C
SOURCE CURRENT	I_{BASE} = maximum nominal primary RMS value of the +IN and –IN inputs
SOURCE ENERGY (Positive and Negative Watthours, Positive and Negative Varhours)	E_{BASE} = 10000 MWh or MVAh, respectively
SOURCE POWER	P_{BASE} = maximum value of $V_{BASE} \times I_{BASE}$ for the +IN and –IN inputs
SOURCE VOLTAGE	V_{BASE} = maximum nominal primary RMS value of the +IN and –IN inputs
SYNCHROCHECK (Max Delta Volts)	V_{BASE} = maximum primary RMS value of all the sources related to the +IN and –IN inputs

The **FLEXELEMENT 1 HYSTERESIS** setting defines the pickup–dropout relation of the element by specifying the width of the hysteresis loop as a percentage of the pickup value as shown in the *FlexElement™ direction, pickup, and hysteresis* diagram.

The **FLEXELEMENT 1 DT UNIT** setting specifies the time unit for the setting **FLEXELEMENT 1 dt**. This setting is applicable only if **FLEXELEMENT 1 COMP MODE** is set to "Delta". The **FLEXELEMENT 1 DT** setting specifies duration of the time interval for the rate of change mode of operation. This setting is applicable only if **FLEXELEMENT 1 COMP MODE** is set to "Delta".

This **FLEXELEMENT 1 PKP DELAY** setting specifies the pickup delay of the element. The **FLEXELEMENT 1 RST DELAY** setting specifies the reset delay of the element.

Each protection element can be assigned up to six different sets of settings according to setting group designations 1 to 6. The performance of these elements is defined by the active setting group at a given time. Multiple setting groups allow the user to conveniently change protection settings for different operating situations (for example, altered power system configuration, season of the year, etc.). The active setting group can be preset or selected via the **SETTING GROUPS** menu (see the *Control elements* section later in this chapter). See also the *Introduction to elements* section at the beginning of this chapter.

5.5.2 SETTING GROUP

In general, a breaker failure scheme determines that a breaker signaled to trip has not cleared a fault within a definite time, so further tripping action must be performed. Tripping from the breaker failure scheme should trip all breakers, both local and remote, that can supply current to the faulted zone. Usually operation of a breaker failure element will cause clearing of a larger section of the power system than the initial trip. Because breaker failure can result in tripping a large number of breakers and this affects system safety and stability, a very high level of security is required.

Two schemes are provided: one for three-pole tripping only (identified by the name "3BF") and one for three pole plus single-pole operation (identified by the name "1BF"). The philosophy used in these schemes is identical. The operation of a breaker failure element includes three stages: initiation, determination of a breaker failure condition, and output.

INITIATION STAGE:

A FlexLogic™ operand representing the protection trip signal initially sent to the breaker must be selected to initiate the scheme. The initiating signal should be sealed-in if primary fault detection can reset before the breaker failure timers have finished timing. The seal-in is supervised by current level, so it is reset when the fault is cleared. If desired, an incomplete sequence seal-in reset can be implemented by using the initiating operand to also initiate a FlexLogic™ timer, set longer than any breaker failure timer, whose output operand is selected to block the breaker failure scheme.

Schemes can be initiated either directly or with current level supervision. It is particularly important in any application to decide if a current-supervised initiate is to be used. The use of a current-supervised initiate results in the breaker failure element not being initiated for a breaker that has very little or no current flowing through it, which may be the case for transformer faults. For those situations where it is required to maintain breaker fail coverage for fault levels below the **BF1 PH AMP SUPV PICKUP** or the **BF1 N AMP SUPV PICKUP** setting, a current supervised initiate should *not* be used. This feature should be utilized for those situations where coordinating margins may be reduced when high speed reclosing is used. Thus, if this choice is made, fault levels must always be above the supervision pickup levels for dependable operation of the breaker fail scheme. This can also occur in breaker-and-a-half or ring bus configurations where the first breaker closes into a fault; the protection trips and attempts to initiate breaker failure for the second breaker, which is in the process of closing, but does not yet have current flowing through it.

When the scheme is initiated, it immediately sends a trip signal to the breaker initially signaled to trip (this feature is usually described as re-trip). This reduces the possibility of widespread tripping that results from a declaration of a failed breaker.

DETERMINATION OF A BREAKER FAILURE CONDITION:

The schemes determine a breaker failure condition via three *paths*. Each of these paths is equipped with a time delay, after which a failed breaker is declared and trip signals are sent to all breakers required to clear the zone. The delayed paths are associated with breaker failure timers 1, 2, and 3, which are intended to have delays increasing with increasing timer numbers. These delayed paths are individually enabled to allow for maximum flexibility.

Timer 1 logic (early path) is supervised by a fast-operating breaker auxiliary contact. If the breaker is still closed (as indicated by the auxiliary contact) and fault current is detected after the delay interval, an output is issued. Operation of the breaker auxiliary switch indicates that the breaker has mechanically operated. The continued presence of current indicates that the breaker has failed to interrupt the circuit.

Timer 2 logic (main path) is not supervised by a breaker auxiliary contact. If fault current is detected after the delay interval, an output is issued. This path is intended to detect a breaker that opens mechanically but fails to interrupt fault current; the logic therefore does not use a breaker auxiliary contact.

The timer 1 and 2 paths provide two levels of current supervision, high-set and low-set, that allow the supervision level to change from a current which flows before a breaker inserts an opening resistor into the faulted circuit to a lower level after resistor insertion. The high-set detector is enabled after timeout of timer 1 or 2, along with a timer that will enable the low-set detector after its delay interval. The delay interval between high-set and low-set is the expected breaker opening time. Both current detectors provide a fast operating time for currents at small multiples of the pickup value. The overcurrent detectors are required to operate after the breaker failure delay interval to eliminate the need for very fast resetting overcurrent detectors.

Timer 3 logic (slow path) is supervised by a breaker auxiliary contact and a control switch contact used to indicate that the breaker is in or out-of-service, disabling this path when the breaker is out-of-service for maintenance. There is no current level check in this logic as it is intended to detect low magnitude faults and it is therefore the slowest to operate.

OUTPUT:

The outputs from the schemes are:

- FlexLogic™ operands that report on the operation of portions of the scheme
- FlexLogic™ operand used to re-trip the protected breaker
- FlexLogic™ operands that initiate tripping required to clear the faulted zone. The trip output can be sealed-in for an adjustable period.
- Target message indicating a failed breaker has been declared
- Illumination of the faceplate Trip LED (and the Phase A, B or C LED, if applicable)

MAIN PATH SEQUENCE:
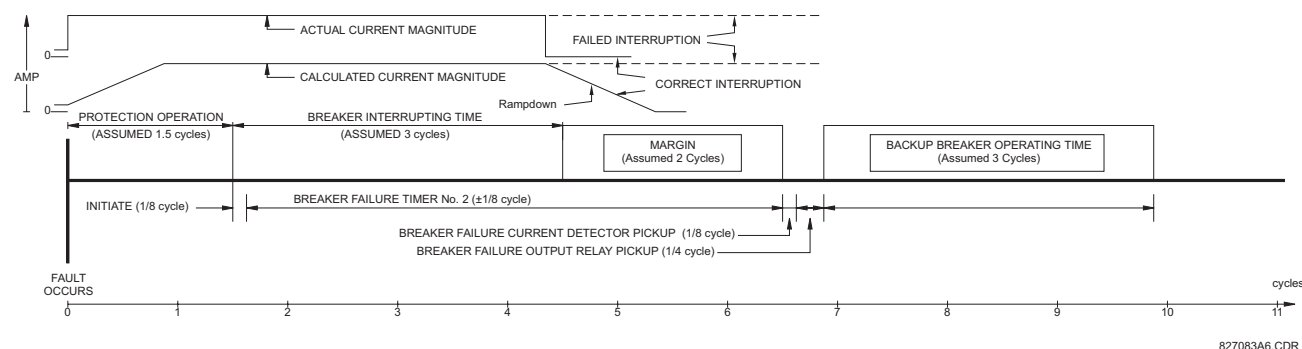

Figure 5–46: BREAKER FAILURE MAIN PATH SEQUENCE

The current supervision elements reset in less than 0.7 of a power cycle for any multiple of pickup current as shown below.
Figure 5–47: BREAKER FAILURE OVERCURRENT SUPERVISION RESET TIME

SETTINGS:

- **BF1 MODE:** This setting is used to select the breaker failure operating mode: single or three pole.

- **BF1 USE AMP SUPV:** If set to "Yes", the element will only be initiated if current flowing through the breaker is above the supervision pickup level.

- **BF1 USE SEAL-IN:** If set to "Yes", the element will only be sealed-in if current flowing through the breaker is above the supervision pickup level.

- **BF1 3-POLE INITIATE:** This setting selects the FlexLogic™ operand that will initiate three-pole tripping of the breaker.

- **BF1 PH AMP SUPV PICKUP:** This setting is used to set the phase current initiation and seal-in supervision level. Generally this setting should detect the lowest expected fault current on the protected breaker. It can be set as low as necessary (lower than breaker resistor current or lower than load current) – high-set and low-set current supervision will guarantee correct operation.

- **BF1 N AMP SUPV PICKUP:** This setting is used to set the neutral current initiate and seal-in supervision level. Generally this setting should detect the lowest expected fault current on the protected breaker. Neutral current supervision is used only in the three phase scheme to provide increased sensitivity. This setting is valid only for three-pole tripping schemes.

- **BF1 USE TIMER 1:** If set to "Yes", the early path is operational.

- **BF1 TIMER 1 PICKUP DELAY:** Timer 1 is set to the shortest time required for breaker auxiliary contact Status-1 to open, from the time the initial trip signal is applied to the breaker trip circuit, plus a safety margin.

- **BF1 USE TIMER 2:** If set to "Yes", the main path is operational.

- **BF1 TIMER 2 PICKUP DELAY:** Timer 2 is set to the expected opening time of the breaker, plus a safety margin. This safety margin was historically intended to allow for measuring and timing errors in the breaker failure scheme equipment. In microprocessor relays this time is not significant. In C60 relays, which use a Fourier transform, the calculated current magnitude will ramp-down to zero one power frequency cycle after the current is interrupted, and this lag should be included in the overall margin duration, as it occurs after current interruption. The *Breaker failure main path sequence* diagram below shows a margin of two cycles; this interval is considered the minimum appropriate for most applications.

  Note that in bulk oil circuit breakers, the interrupting time for currents less than 25% of the interrupting rating can be significantly longer than the normal interrupting time.

- **BF1 USE TIMER 3:** If set to "Yes", the Slow Path is operational.

- **BF1 TIMER 3 PICKUP DELAY:** Timer 3 is set to the same interval as timer 2, plus an increased safety margin. Because this path is intended to operate only for low level faults, the delay can be in the order of 300 to 500 ms.

- **BF1 BKR POS1** φA**/3P:** This setting selects the FlexLogic™ operand that represents the protected breaker early-type auxiliary switch contact (52/a). When using the single-pole breaker failure scheme, this operand represents the protected breaker early-type auxiliary switch contact on pole A. This is normally a non-multiplied form-A contact. The contact may even be adjusted to have the shortest possible operating time.

- **BF1 BKR POS2** φA**/3P:** This setting selects the FlexLogic™ operand that represents the breaker normal-type auxiliary switch contact (52/a). When using the single-pole breaker failure scheme, this operand represents the protected breaker auxiliary switch contact on pole A. This may be a multiplied contact.

- **BF1 BREAKER TEST ON:** This setting is used to select the FlexLogic™ operand that represents the breaker in-service/out-of-service switch set to the out-of-service position.

- **BF1 PH AMP HISET PICKUP:** This setting sets the phase current output supervision level. Generally this setting should detect the lowest expected fault current on the protected breaker, before a breaker opening resistor is inserted.

- **BF1 N AMP HISET PICKUP:** This setting sets the neutral current output supervision level. Generally this setting should detect the lowest expected fault current on the protected breaker, before a breaker opening resistor is inserted. Neutral current supervision is used only in the three pole scheme to provide increased sensitivity. *This setting is valid only for three-pole breaker failure schemes.*

- **BF1 PH AMP LOSET PICKUP:** This setting sets the phase current output supervision level. Generally this setting should detect the lowest expected fault current on the protected breaker, after a breaker opening resistor is inserted (approximately 90% of the resistor current).

- **BF1 N AMP LOSET PICKUP:** This setting sets the neutral current output supervision level. Generally this setting should detect the lowest expected fault current on the protected breaker, after a breaker opening resistor is inserted (approximately 90% of the resistor current). *This setting is valid only for three-pole breaker failure schemes.*

- **BF1 LOSET TIME DELAY:** Sets the pickup delay for current detection after opening resistor insertion.

- **BF1 TRIP DROPOUT DELAY:** This setting is used to set the period of time for which the trip output is sealed-in. This timer must be coordinated with the automatic reclosing scheme of the failed breaker, to which the breaker failure element sends a cancel reclosure signal. Reclosure of a remote breaker can also be prevented by holding a transfer trip signal on longer than the reclaim time.

- **BF1 PH A INITIATE / BF1 PH B INITIATE / BF 1 PH C INITIATE:** These settings select the FlexLogic™ operand to initiate phase A, B, or C single-pole tripping of the breaker and the phase A, B, or C portion of the scheme, accordingly. *This setting is only valid for single-pole breaker failure schemes.*

- **BF1 BKR POS1** φB **/ BF1 BKR POS 1** φC**:** These settings select the FlexLogic™ operand to represents the protected breaker early-type auxiliary switch contact on poles B or C, accordingly. This contact is normally a non-multiplied Form-A contact. The contact may even be adjusted to have the shortest possible operating time. *This setting is valid only for single-pole breaker failure schemes.*

- **BF1 BKR POS2** φB**:** Selects the FlexLogic™ operand that represents the protected breaker normal-type auxiliary switch contact on pole B (52/a). This may be a multiplied contact. *This setting is valid only for single-pole breaker failure schemes.*

- **BF1 BKR POS2** φC**:** This setting selects the FlexLogic™ operand that represents the protected breaker normal-type auxiliary switch contact on pole C (52/a). This may be a multiplied contact. For single-pole operation, the scheme has the same overall general concept except that it provides re-tripping of each single pole of the protected breaker. The approach shown in the following single pole tripping diagram uses the initiating information to determine which pole is supposed to trip. The logic is segregated on a per-pole basis. The overcurrent detectors have ganged settings. *This setting is valid only for single-pole breaker failure schemes.*

  Upon operation of the breaker failure element for a single pole trip command, a three-pole trip command should be given via output operand BKR FAIL 1 TRIP OP.

The C60 contains protection elements for phase time overcurrent (ANSI device 51P) and phase instantaneous overcurrent (ANSI device 50P). A maximum of six phase time overcurrent and eight phase instantaneous overcurrent elements are available, dependent on the CT/VT modules ordered with the relay. See the following table for details.

CT/VT MODULES		PHASE CURRENT ELEMENTS	
SLOT F	SLOT M	TIME OVERCURRENT	INSTANTANEOUS OVERCURRENT
8F/8G	8F/8G	4	4
	8H/8J	6	6
8H/8J	8F/8G	6	6
	8H/8J	6	6

b) INVERSE TOC CURVE CHARACTERISTICS

The inverse time overcurrent curves used by the time overcurrent elements are the IEEE, IEC, GE Type IAC, and I^{2}t standard curve shapes. This allows for simplified coordination with downstream devices.

If none of these curve shapes is adequate, FlexCurves™ may be used to customize the inverse time curve characteristics. The definite time curve is also an option that may be appropriate if only simple protection is required.

Table 5–11: OVERCURRENT CURVE TYPES

IEEE	IEC	GE TYPE IAC	OTHER
IEEE Extremely Inverse	IEC Curve A (BS142)	IAC Extremely Inverse	I^{2}t
IEEE Very Inverse	IEC Curve B (BS142)	IAC Very Inverse	FlexCurves™ A, B, C, and D
IEEE Moderately Inverse	IEC Curve C (BS142)	IAC Inverse	Recloser Curves
	IEC Short Inverse	IAC Short Inverse	Definite Time

A time dial multiplier setting allows selection of a multiple of the base curve shape (where the time dial multiplier = 1) with the curve shape (**CURVE**) setting. Unlike the electromechanical time dial equivalent, operate times are directly proportional to the time multiplier (**TD MULTIPLIER**) setting value. For example, all times for a multiplier of 10 are 10 times the multiplier 1 or base curve values. Setting the multiplier to zero results in an instantaneous response to all current levels above pickup.

Time overcurrent time calculations are made with an internal *energy capacity* memory variable. When this variable indicates that the energy capacity has reached 100%, a time overcurrent element will operate. If less than 100% energy capacity is accumulated in this variable and the current falls below the dropout threshold of 97 to 98% of the pickup value, the variable must be reduced. Two methods of this resetting operation are available: "Instantaneous" and "Timed". The "Instantaneous" selection is intended for applications with other relays, such as most static relays, which set the energy capacity directly to zero when the current falls below the reset threshold. The "Timed" selection can be used where the relay must coordinate with electromechanical relays.

IEEE CURVES:

The IEEE time overcurrent curve shapes conform to industry standards and the IEEE C37.112-1996 curve classifications for extremely, very, and moderately inverse. The IEEE curves are derived from the formulae:

$$T = TDM \times \left[\frac{A}{\left(\frac{I}{I_{pickup}}\right)^p - 1} + B \right], \; T_{RESET} = TDM \times \left[\frac{t_r}{1 - \left(\frac{I}{I_{pickup}}\right)^2} \right]$$ **(EQ 5.8)**

where: T = operate time (in seconds), TDM = Multiplier setting, I = input current, I_{pickup} = Pickup Current setting
A, B, p = constants, T_{RESET} = reset time in seconds (assuming energy capacity is 100% and **RESET** is "Timed"),
t_r = characteristic constant

IEC CURVES

For European applications, the relay offers three standard curves defined in IEC 255-4 and British standard BS142. These are defined as IEC Curve A, IEC Curve B, and IEC Curve C. The formulae for these curves are:

$$T = TDM \times \left[\frac{K}{(I/I_{pickup})^E - 1} \right], \quad T_{RESET} = TDM \times \left[\frac{t_r}{1 - (I/I_{pickup})^2} \right]$$

(EQ 5.9)

where: T = operate time (in seconds), TDM = Multiplier setting, I = input current, I_{pickup} = Pickup Current setting, K, E = constants, t_r = characteristic constant, and T_{RESET} = reset time in seconds (assuming energy capacity is 100% and **RESET** is "Timed")

Table 5–14: IEC (BS) INVERSE TIME CURVE CONSTANTS

IAC CURVES:

The curves for the General Electric type IAC relay family are derived from the formulae:

$$T = \text{TDM} \times \left(A + \frac{B}{(I/I_{pkp}) - C} + \frac{D}{((I/I_{pkp}) - C)^2} + \frac{E}{((I/I_{pkp}) - C)^3} \right), \quad T_{RESET} = \text{TDM} \times \left[\frac{t_r}{1 - (I/I_{pkp})^2} \right] \qquad \textbf{(EQ 5.10)}$$

where: T = operate time (in seconds), TDM = Multiplier setting, I = Input current, I_{pkp} = Pickup Current setting, A to E = constants, t_r = characteristic constant, and T_{RESET} = reset time in seconds (assuming energy capacity is 100% and **RESET** is "Timed")

I2t CURVES:

The curves for the I^2t are derived from the formulae:

$$T = \text{TDM} \times \left[\frac{100}{\left(\frac{I}{I_{pickup}}\right)^2}\right], \quad T_{RESET} = \text{TDM} \times \left[\frac{100}{\left(\frac{I}{I_{pickup}}\right)^{-2}}\right] \quad \textbf{(EQ 5.11)}$$

where: T = Operate Time (sec.); TDM = Multiplier Setting; I = Input Current; I_{pickup} = Pickup Current Setting;
T_{RESET} = Reset Time in sec. (assuming energy capacity is 100% and RESET: Timed)

Table 5–18: I²T CURVE TRIP TIMES

FLEXCURVES™:

The custom FlexCurves™ are described in detail in the FlexCurves™ section of this chapter. The curve shapes for the FlexCurves™ are derived from the formulae:

$$T = \text{TDM} \times \left[\text{FlexCurve Time at} \left(\frac{I}{I_{pickup}}\right)\right] \quad \text{when} \left(\frac{I}{I_{pickup}}\right) \geq 1.00 \quad \textbf{(EQ 5.12)}$$

$$T_{RESET} = \text{TDM} \times \left[\text{FlexCurve Time at} \left(\frac{I}{I_{pickup}}\right)\right] \quad \text{when} \left(\frac{I}{I_{pickup}}\right) \leq 0.98 \quad \textbf{(EQ 5.13)}$$

where: T = Operate Time (sec.), TDM = Multiplier setting
I = Input Current, I_{pickup} = Pickup Current setting
T_{RESET} = Reset Time in seconds (assuming energy capacity is 100% and RESET: Timed)

DEFINITE TIME CURVE:

The Definite Time curve shape operates as soon as the pickup level is exceeded for a specified period of time. The base definite time curve delay is in seconds. The curve multiplier of 0.00 to 600.00 makes this delay adjustable from instantaneous to 600.00 seconds in steps of 10 ms.

$$T = \text{TDM} \text{ in seconds, when } I > I_{pickup} \quad \textbf{(EQ 5.14)}$$

$$T_{RESET} = \text{TDM} \text{ in seconds} \quad \textbf{(EQ 5.15)}$$

where: T = Operate Time (sec.), TDM = Multiplier setting
I = Input Current, I_{pickup} = Pickup Current setting
T_{RESET} = Reset Time in seconds (assuming energy capacity is 100% and RESET: Timed)

RECLOSER CURVES:

The C60 uses the FlexCurve™ feature to facilitate programming of 41 recloser curves. Please refer to the FlexCurve™ section in this chapter for additional details.

The phase time overcurrent element can provide a desired time-delay operating characteristic versus the applied current or be used as a simple definite time element. The phase current input quantities may be programmed as fundamental phasor magnitude or total waveform RMS magnitude as required by the application.

Two methods of resetting operation are available: "Timed" and "Instantaneous" (refer to the Inverse *Time overcurrent curves characteristic* sub-section earlier for details on curve setup, trip times, and reset operation). When the element is blocked, the time accumulator will reset according to the reset characteristic. For example, if the element reset characteristic is set to "Instantaneous" and the element is blocked, the time accumulator will be cleared immediately.

The **PHASE TOC1 PICKUP** setting can be dynamically reduced by a voltage restraint feature (when enabled). This is accomplished via the multipliers (Mvr) corresponding to the phase-phase voltages of the voltage restraint characteristic curve (see the figure below); the pickup level is calculated as 'Mvr' times the **PHASE TOC1 PICKUP** setting. If the voltage restraint feature is disabled, the pickup level always remains at the setting value.

The neutral instantaneous overcurrent element may be used as an instantaneous function with no intentional delay or as a definite time function. The element essentially responds to the magnitude of a neutral current fundamental frequency phasor calculated from the phase currents. A positive-sequence restraint is applied for better performance. A small portion (6.25%) of the positive-sequence current magnitude is subtracted from the zero-sequence current magnitude when forming the operating quantity of the element as follows:

$$I_{op} = 3 \times (|I\_0| - K \cdot |I\_1|) \quad \text{where } K = 1/16 \tag{EQ 5.16}$$

The positive-sequence restraint allows for more sensitive settings by counterbalancing spurious zero-sequence currents resulting from:

- System unbalances under heavy load conditions
- Transformation errors of current transformers (CTs) during double-line and three-phase faults.
- Switch-off transients during double-line and three-phase faults.

The positive-sequence restraint must be considered when testing for pickup accuracy and response time (multiple of pickup). The operating quantity depends on how test currents are injected into the relay (single-phase injection: $I_{op} = 0.9375 \cdot I_{injected}$; three-phase pure zero-sequence injection: $I_{op} = 3 \times I_{injected}$).

These protection elements can be used for a variety of applications such as:

* ***Undervoltage Protection:*** For voltage sensitive loads, such as induction motors, a drop in voltage increases the drawn current which may cause dangerous overheating in the motor. The undervoltage protection feature can be used to either cause a trip or generate an alarm when the voltage drops below a specified voltage setting for a specified time delay.

* ***Permissive Functions:*** The undervoltage feature may be used to block the functioning of external devices by operating an output relay when the voltage falls below the specified voltage setting. The undervoltage feature may also be used to block the functioning of other elements through the block feature of those elements.

* ***Source Transfer Schemes:*** In the event of an undervoltage, a transfer signal may be generated to transfer a load from its normal source to a standby or emergency power source.

The undervoltage elements can be programmed to have a definite time delay characteristic. The definite time curve operates when the voltage drops below the pickup level for a specified period of time. The time delay is adjustable from 0 to 600.00 seconds in steps of 0.01. The undervoltage elements can also be programmed to have an inverse time delay characteristic.

The undervoltage delay setting defines the family of curves shown below.

$$T = \frac{D}{\left(1 - \frac{V}{V_{pickup}}\right)}$$

(EQ 5.17)

where: T = operating time
   D = undervoltage delay setting (D = 0.00 operates instantaneously)
   V = secondary voltage applied to the relay
   V_{pickup} = pickup level

This element may be used to give a desired time-delay operating characteristic versus the applied fundamental voltage (phase-to-ground or phase-to-phase for wye VT connection, or phase-to-phase for delta VT connection) or as a definite time element. The element resets instantaneously if the applied voltage exceeds the dropout voltage. The delay setting selects the minimum operating time of the phase undervoltage. The minimum voltage setting selects the operating voltage below which the element is blocked (a setting of "0" will allow a dead source to be considered a fault condition).

There are three neutral overvoltage elements available. The neutral overvoltage element can be used to detect asymmetrical system voltage condition due to a ground fault or to the loss of one or two phases of the source. The element responds to the system neutral voltage (3V_0), calculated from the phase voltages. The nominal secondary voltage of the phase voltage channels entered under **SETTINGS ⇨⇩ SYSTEM SETUP ⇨ AC INPUTS ⇨⇩ VOLTAGE BANK ⇨ PHASE VT SECONDARY** is the p.u. base used when setting the pickup level.

The neutral overvoltage element can provide a time-delayed operating characteristic versus the applied voltage (initialized from FlexCurves A, B, or C) or be used as a definite time element. The **NEUTRAL OV1 PICKUP DELAY** setting applies only if the **NEUTRAL OV1 CURVE** setting is "Definite time". The source assigned to this element must be configured for a phase VT.

VT errors and normal voltage unbalance must be considered when setting this element. This function requires the VTs to be wye-connected.

The C60 contains one auxiliary undervoltage element for each VT bank. This element is intended for monitoring undervoltage conditions of the auxiliary voltage. The **AUX UV1 PICKUP** selects the voltage level at which the time undervoltage element starts timing. The nominal secondary voltage of the auxiliary voltage channel entered under **SETTINGS ⇨⇩ SYSTEM SETUP ⇨ AC INPUTS ⇨⇩ VOLTAGE BANK X5 ⇨⇩ AUXILIARY VT X5 SECONDARY** is the per-unit base used when setting the pickup level.

The **AUX UV1 DELAY** setting selects the minimum operating time of the auxiliary undervoltage element. Both **AUX UV1 PICKUP** and **AUX UV1 DELAY** settings establish the operating curve of the undervoltage element. The auxiliary undervoltage element can be programmed to use either definite time delay or inverse time delay characteristics. The operating characteristics and equations for both definite and inverse time delay are as for the phase undervoltage element.

The element resets instantaneously. The minimum voltage setting selects the operating voltage below which the element is blocked.
Figure 5–62: AUXILIARY UNDERVOLTAGE SCHEME LOGIC

e) AUXILIARY OVERVOLTAGE (ANSI 59X)

PATH: SETTINGS ⇨⇩ GROUPED ELEMENTS ⇨ SETTING GROUP 1(6) ⇨⇩ VOLTAGE ELEMENTS ⇨⇩ AUXILIARY OV1(2)

The C60 contains one auxiliary overvoltage element for each VT bank. This element is intended for monitoring overvoltage conditions of the auxiliary voltage. The nominal secondary voltage of the auxiliary voltage channel entered under **SYSTEM SETUP ⇨ AC INPUTS ⇩⇨ VOLTAGE BANK X5 ⇩⇨ AUXILIARY VT X5 SECONDARY** is the per-unit (pu) base used when setting the pickup level.

A typical application for this element is monitoring the zero-sequence voltage (3V_0) supplied from an open-corner-delta VT connection.

The sensitive directional power element responds to three-phase directional power and is designed for reverse power and low forward power applications for synchronous machines or interconnections involving co-generation. The relay measures the three-phase power from either full set of wye-connected VTs or full-set of delta-connected VTs. In the latter case, the two-wattmeter method is used. Refer to the *UR-series metering conventions* section in chapter 6 for details regarding the active and reactive powers used by the sensitive directional power element.

The element has an adjustable characteristic angle and minimum operating power as shown in the *Directional power characteristic* diagram. The element responds to the following condition:

$$P\cos\theta + Q\sin\theta > SMIN \tag{EQ 5.18}$$

where: P and Q are active and reactive powers as measured per the UR-series metering convention,
     θ is a sum of the element characteristic (**DIR POWER 1 RCA**) and calibration (**DIR POWER 1 CALIBRATION**) angles, and
     $SMIN$ is the minimum operating power

The operating quantity is displayed in the **ACTUAL VALUES** ⇨ **METERING** ⇨⇩ **SENSITIVE DIRECTIONAL POWER 1(2)** actual value. The element has two independent (as to the pickup and delay settings) stages for alarm and trip, respectively.
Figure 5–64: DIRECTIONAL POWER CHARACTERISTIC

By making the characteristic angle adjustable and providing for both negative and positive values of the minimum operating power a variety of operating characteristics can be achieved as presented in the figure below. For example, section (a) in the figure below shows settings for reverse power, while section (b) shows settings for low forward power applications.
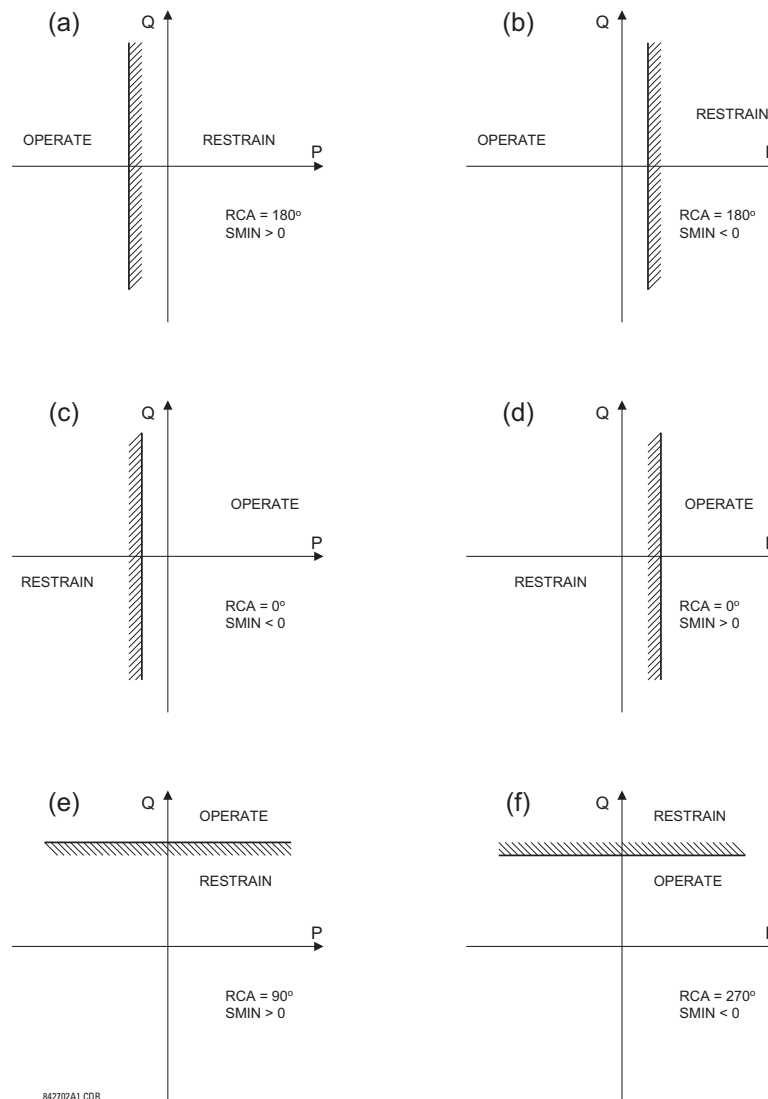

Figure 5–65: DIRECTIONAL POWER ELEMENT SAMPLE APPLICATIONS

- **DIR POWER 1 RCA:** Specifies the relay characteristic angle (RCA) for the sensitive directional power function. Application of this setting is threefold:

  1. It allows the element to respond to active or reactive power in any direction (active overpower/underpower, etc.).

  2. Together with a precise calibration angle, it allows compensation for any CT and VT angular errors to permit more sensitive settings.

  3. It allows for required direction in situations when the voltage signal is taken from behind a delta-wye connected power transformer and the phase angle compensation is required.

  For example, the active overpower characteristic is achieved by setting **DIR POWER 1 RCA** to "0°", reactive overpower by setting **DIR POWER 1 RCA** to "90°", active underpower by setting **DIR POWER 1 RCA** to "180°", and reactive underpower by setting **DIR POWER 1 RCA** to "270°".

- **DIR POWER 1 CALIBRATION:** This setting allows the relay characteristic angle to change in steps of 0.05°. This may be useful when a small difference in VT and CT angular errors is to be compensated to permit more sensitive settings. This setting virtually enables calibration of the directional power function in terms of the angular error of applied VTs and CTs. The element responds to the sum of the **DIR POWER 1 RCA** and **DIR POWER 1 CALIBRATION** settings.

- **DIR POWER 1 STG1 SMIN:** This setting specifies the minimum power as defined along the relay characteristic angle (RCA) for the stage 1 of the element. The positive values imply a shift towards the operate region along the RCA line; the negative values imply a shift towards the restrain region along the RCA line. Refer to the *Directional power sample applications* figure for details. Together with the RCA, this setting enables a wide range of operating characteristics. This setting applies to three-phase power and is entered in per-unit (pu) values. The base quantity is $3 \times$ VT pu base $\times$ CT pu base.

  For example, a setting of 2% for a 200 MW machine is 0.02×200 MW = 4 MW. If 7.967 kV is a primary VT voltage and 10 kA is a primary CT current, the source pu quantity is 239 MVA, and thus, SMIN should be set at 4 MW / 239 MVA = 0.0167 pu $\approx$ 0.017 pu. If the reverse power application is considered, RCA = 180° and SMIN = 0.017 pu.

  The element drops out if the magnitude of the positive-sequence current becomes virtually zero, that is, it drops below the cutoff level.

- **DIR POWER 1 STG1 DELAY:** This setting specifies a time delay for stage 1. For reverse power or low forward power applications for a synchronous machine, stage 1 is typically applied for alarming and stage 2 for tripping.
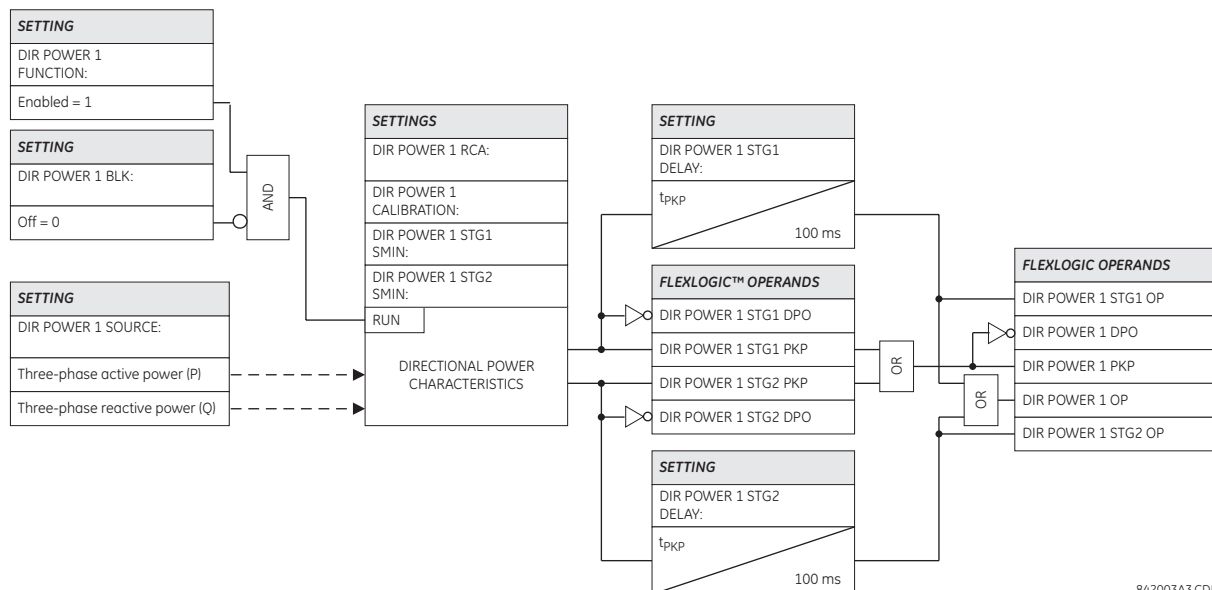

Figure 5–66: SENSITIVE DIRECTIONAL POWER SCHEME LOGIC

Control elements are generally used for control rather than protection. See the *Introduction to Elements* section at the beginning of this chapter for further information.

5.6.2 SETTING GROUPS

PATH: SETTINGS ⇨⇩ CONTROL ELEMENTS ⇨ SETTINGS GROUPS

■ SETTING GROUPS ■	◀▮▶	SETTING GROUPS FUNCTION: Disabled	*Range: Disabled, Enabled*
MESSAGE	▲▼	SETTING GROUPS BLK: Off	*Range: FlexLogic™ operand*

MESSAGE	▲	SETTING GROUP EVENTS: Disabled	*Range: Disabled, Enabled*

The setting groups menu controls the activation/deactivation of up to six possible groups of settings in the **GROUPED ELE-MENTS** settings menu. The faceplate Settings In Use LEDs indicate which active group (with a non-flashing energized LED) is in service.

The **SETTING GROUPS BLK** setting prevents the active setting group from changing when the FlexLogic™ parameter is set to "On". This can be useful in applications where it is undesirable to change the settings under certain conditions, such as the breaker being open.

The **GROUP 2 ACTIVATE ON** to **GROUP 6 ACTIVATE ON** settings select a FlexLogic™ operand which, when set, will make the particular setting group active for use by any grouped element. A priority scheme ensures that only one group is active at a given time – the highest-numbered group which is activated by its **ACTIVATE ON** parameter takes priority over the lower-numbered groups. There is no activate on setting for group 1 (the default active group), because group 1 automatically becomes active if no other group is active.

The **SETTING GROUP 1 NAME** to **SETTING GROUP 6 NAME** settings allows to user to assign a name to each of the six settings groups. Once programmed, this name will appear on the second line of the **GROUPED ELEMENTS ⇨ SETTING GROUP 1(6)** menu display.

The relay can be set up via a FlexLogic™ equation to receive requests to activate or de-activate a particular non-default settings group. The following FlexLogic™ equation (see the figure below) illustrates requests via remote communications (for example, VIRTUAL INPUT 1 ON) or from a local contact input (for example, CONTACT IP 1 ON) to initiate the use of a particular settings group, and requests from several overcurrent pickup measuring elements to inhibit the use of the particular settings group. The assigned VIRTUAL OUTPUT 1 operand is used to control the "On" state of a particular settings group.
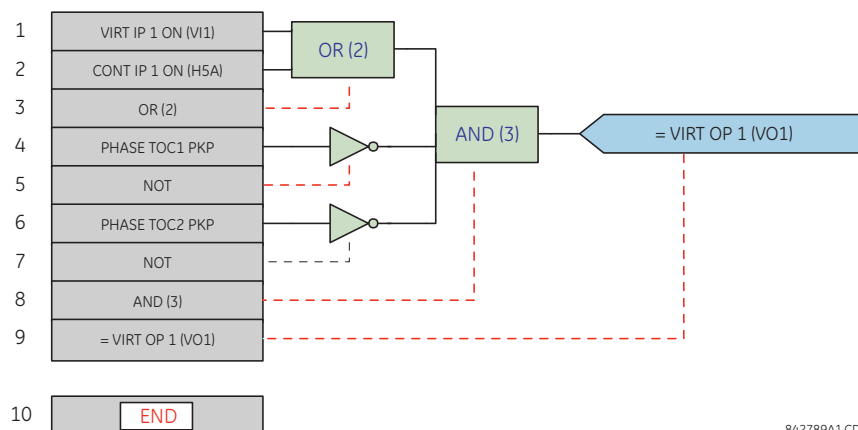

Figure 5–67: EXAMPLE FLEXLOGIC™ CONTROL OF A SETTINGS GROUP

The selector switch element is intended to replace a mechanical selector switch. Typical applications include setting group control or control of multiple logic sub-circuits in user-programmable logic.

The element provides for two control inputs. The step-up control allows stepping through selector position one step at a time with each pulse of the control input, such as a user-programmable pushbutton. The three-bit control input allows setting the selector to the position defined by a three-bit word.

The element allows pre-selecting a new position without applying it. The pre-selected position gets applied either after time-out or upon acknowledgement via separate inputs (user setting). The selector position is stored in non-volatile memory. Upon power-up, either the previous position is restored or the relay synchronizes to the current three-bit word (user setting). Basic alarm functionality alerts the user under abnormal conditions; for example, the three-bit control input being out of range.

- **SELECTOR 1 FULL RANGE**: This setting defines the upper position of the selector. When stepping up through available positions of the selector, the upper position wraps up to the lower position (position 1). When using a direct three-bit control word for programming the selector to a desired position, the change would take place only if the control word is within the range of 1 to the **SELECTOR FULL RANGE**. If the control word is outside the range, an alarm is established by setting the SELECTOR ALARM FlexLogic™ operand for 3 seconds.

- **SELECTOR 1 TIME-OUT:** This setting defines the time-out period for the selector. This value is used by the relay in the following two ways. When the **SELECTOR STEP-UP MODE** is "Time-out", the setting specifies the required period of inactivity of the control input after which the pre-selected position is automatically applied. When the **SELECTOR STEP-UP MODE** is "Acknowledge", the setting specifies the period of time for the acknowledging input to appear. The timer is re-started by any activity of the control input. The acknowledging input must come before the **SELECTOR 1 TIME-OUT** timer expires; otherwise, the change will not take place and an alarm will be set.

- **SELECTOR 1 STEP-UP**: This setting specifies a control input for the selector switch. The switch is shifted to a new position at each rising edge of this signal. The position changes incrementally, wrapping up from the last (**SELECTOR 1 FULL RANGE**) to the first (position 1). Consecutive pulses of this control operand must not occur faster than every 50 ms. After each rising edge of the assigned operand, the time-out timer is restarted and the **SELECTOR SWITCH 1: POS Z CHNG INITIATED** target message is displayed, where *Z* the pre-selected position. The message is displayed for the time specified by the **FLASH MESSAGE TIME** setting. The pre-selected position is applied after the selector times out ("Time-out" mode), or when the acknowledging signal appears before the element times out ("Acknowledge" mode). When the new position is applied, the relay displays the **SELECTOR SWITCH 1: POSITION Z IN USE** message. Typically, a user-programmable pushbutton is configured as the stepping up control input.

- **SELECTOR 1 STEP-UP MODE**: This setting defines the selector mode of operation. When set to "Time-out", the selector will change its position after a pre-defined period of inactivity at the control input. The change is automatic and does not require any explicit confirmation of the intent to change the selector's position. When set to "Acknowledge", the selector will change its position only after the intent is confirmed through a separate acknowledging signal. If the acknowledging signal does not appear within a pre-defined period of time, the selector does not accept the change and an alarm is established by setting the SELECTOR STP ALARM output FlexLogic™ operand for 3 seconds.

- **SELECTOR 1 ACK**: This setting specifies an acknowledging input for the stepping up control input. The pre-selected position is applied on the rising edge of the assigned operand. This setting is active only under "Acknowledge" mode of operation. The acknowledging signal must appear within the time defined by the **SELECTOR 1 TIME-OUT** setting after the last activity of the control input. A user-programmable pushbutton is typically configured as the acknowledging input.

- **SELECTOR 1 3BIT A0, A1, and A2**: These settings specify a three-bit control input of the selector. The three-bit control word pre-selects the position using the following encoding convention:

A2	A1	A0	POSITION
0	0	0	rest
0	0	1	1
0	1	0	2
0	1	1	3
1	0	0	4
1	0	1	5
1	1	0	6
1	1	1	7

The "rest" position (0, 0, 0) does not generate an action and is intended for situations when the device generating the three-bit control word is having a problem. When **SELECTOR 1 3BIT MODE** is "Time-out", the pre-selected position is applied in **SELECTOR 1 TIME-OUT** seconds after the last activity of the three-bit input. When **SELECTOR 1 3BIT MODE** is "Acknowledge", the pre-selected position is applied on the rising edge of the **SELECTOR 1 3BIT ACK** acknowledging input.

The stepping up control input (**SELECTOR 1 STEP-UP**) and the three-bit control inputs (**SELECTOR 1 3BIT A0** through **A2**) lock-out mutually: once the stepping up sequence is initiated, the three-bit control input is inactive; once the three-bit control sequence is initiated, the stepping up input is inactive.

- **SELECTOR 1 3BIT MODE**: This setting defines the selector mode of operation. When set to "Time-out", the selector changes its position after a pre-defined period of inactivity at the control input. The change is automatic and does not require explicit confirmation to change the selector position. When set to "Acknowledge", the selector changes its position only after confirmation via a separate acknowledging signal. If the acknowledging signal does not appear within a pre-defined period of time, the selector rejects the change and an alarm established by invoking the SELECTOR BIT ALARM FlexLogic™ operand for 3 seconds.

- **SELECTOR 1 3BIT ACK**: This setting specifies an acknowledging input for the three-bit control input. The pre-selected position is applied on the rising edge of the assigned FlexLogic™ operand. This setting is active only under the "Acknowledge" mode of operation. The acknowledging signal must appear within the time defined by the **SELEC-TOR TIME-OUT** setting after the last activity of the three-bit control inputs. Note that the stepping up control input and three-bit control input have independent acknowledging signals (**SELECTOR 1 ACK** and **SELECTOR 1 3BIT ACK**, accordingly).

- **SELECTOR 1 POWER-UP MODE**: This setting specifies the element behavior on power up of the relay.

  When set to "Restore", the last position of the selector (stored in the non-volatile memory) is restored after powering up the relay. If the position restored from memory is out of range, position 0 (no output operand selected) is applied and an alarm is set (SELECTOR 1 PWR ALARM).

  When set to "Synchronize" selector switch acts as follows. For two power cycles, the selector applies position 0 to the switch and activates SELECTOR 1 PWR ALARM. After two power cycles expire, the selector synchronizes to the position dictated by the three-bit control input. This operation does not wait for time-out or the acknowledging input. When the synchronization attempt is unsuccessful (that is, the three-bit input is not available (0,0,0) or out of range) then the selector switch output is set to position 0 (no output operand selected) and an alarm is established (SELECTOR 1 PWR ALARM).

  The operation of "Synch/Restore" mode is similar to the "Synchronize" mode. The only difference is that after an unsuccessful synchronization attempt, the switch will attempt to restore the position stored in the relay memory. The "Synch/Restore" mode is useful for applications where the selector switch is employed to change the setting group in redundant (two relay) protection schemes.

- **SELECTOR 1 EVENTS**: If enabled, the following events are logged:

EVENT NAME	DESCRIPTION
SELECTOR 1 POS *Z*	Selector 1 changed its position to *Z*.
SELECTOR 1 STP ALARM	The selector position pre-selected via the stepping up control input has not been confirmed before the time out.
SELECTOR 1 BIT ALARM	The selector position pre-selected via the three-bit control input has not been confirmed before the time out.

The following figures illustrate the operation of the selector switch. In these diagrams, "T" represents a time-out setting.
Figure 5–68: TIME-OUT MODE
Figure 5–69: ACKNOWLEDGE MODE

Application example

Consider an application where the selector switch is used to control setting groups 1 through 4 in the relay. The setting groups are to be controlled from both user-programmable pushbutton 1 and from an external device via contact inputs 1 through 3. The active setting group shall be available as an encoded three-bit word to the external device and SCADA via output contacts 1 through 3. The pre-selected setting group shall be applied automatically after 5 seconds of inactivity of the control inputs. When the relay powers up, it should synchronize the setting group to the three-bit control input.

Make the following changes to setting group control in the **SETTINGS** ⇨ ⇩ **CONTROL ELEMENTS** ⇨ **SETTING GROUPS** menu:

SETTING GROUPS FUNCTION: "Enabled"
SETTING GROUPS BLK: "Off"
GROUP 2 ACTIVATE ON: "SELECTOR 1 POS 2"
GROUP 3 ACTIVATE ON: "SELECTOR 1 POS 3"
GROUP 4 ACTIVATE ON: "SELECTOR 1 POS 4"
GROUP 5 ACTIVATE ON: "Off"
GROUP 6 ACTIVATE ON: "Off"

Make the following changes to selector switch element in the **SETTINGS** ⇨ ⇩ **CONTROL ELEMENTS** ⇨ ⇩ **SELECTOR SWITCH** ⇨ **SELECTOR SWITCH 1** menu to assign control to user programmable pushbutton 1 and contact inputs 1 through 3:

SELECTOR 1 FUNCTION: "Enabled"   **SELECTOR 1 3BIT A0:** "CONT IP 1 ON"
SELECTOR 1 FULL-RANGE: "4"   **SELECTOR 1 3BIT A1:** "CONT IP 2 ON"
SELECTOR 1 STEP-UP MODE: "Time-out"   **SELECTOR 1 3BIT A2:** "CONT IP 3 ON"
SELECTOR 1 TIME-OUT: "5.0 s"   **SELECTOR 1 3BIT MODE:** "Time-out"
SELECTOR 1 STEP-UP: "PUSHBUTTON 1 ON"   **SELECTOR 1 3BIT ACK:** "Off"
SELECTOR 1 ACK: "Off"   **SELECTOR 1 POWER-UP MODE:** "Synchronize"

Now, assign the contact output operation (assume the H6E module) to the selector switch element by making the following changes in the **SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ CONTACT OUTPUTS** menu:

OUTPUT H1 OPERATE: "SELECTOR 1 BIT 0"
OUTPUT H2 OPERATE: "SELECTOR 1 BIT 1"
OUTPUT H3 OPERATE: "SELECTOR 1 BIT 2"

Finally, assign configure user-programmable pushbutton 1 by making the following changes in the **SETTINGS ⇨ PRODUCT SETUP ⇨⇩ USER-PROGRAMMABLE PUSHBUTTONS ⇨ USER PUSHBUTTON 1** menu:

PUSHBUTTON 1 FUNCTION: "Self-reset"
PUSHBUTTON 1 DROP-OUT TIME: "0.10 s"

The logic for the selector switch is shown below:
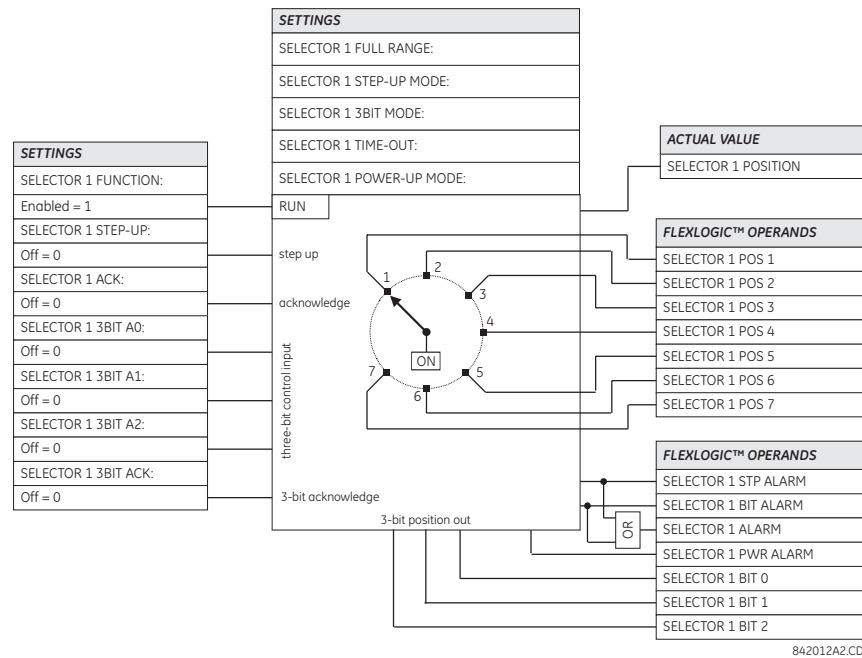

Figure 5–70: SELECTOR SWITCH LOGIC

MESSAGE	SYNCHK1 TARGET: Self-reset	*Range: Self-reset, Latched, Disabled*
MESSAGE	SYNCHK1 EVENTS: Disabled	*Range: Disabled, Enabled*

The are two identical synchrocheck elements available, numbered 1 and 2.

The synchronism check function is intended for supervising the paralleling of two parts of a system which are to be joined by the closure of a circuit breaker. The synchrocheck elements are typically used at locations where the two parts of the system are interconnected through at least one other point in the system.

Synchrocheck verifies that the voltages (V1 and V2) on the two sides of the supervised circuit breaker are within set limits of magnitude, angle and frequency differences. The time that the two voltages remain within the admissible angle difference is determined by the setting of the phase angle difference ΔΦ and the frequency difference ΔF (slip frequency). It can be defined as the time it would take the voltage phasor V1 or V2 to traverse an angle equal to 2 × ΔΦ at a frequency equal to the frequency difference ΔF. This time can be calculated by:

$$T = \frac{1}{\dfrac{360°}{2 \times \Delta\Phi} \times \Delta F}$$ **(EQ 5.19)**

where: ΔΦ = phase angle difference in degrees; ΔF = frequency difference in Hz.

If one or both sources are de-energized, the synchrocheck programming can allow for closing of the circuit breaker using undervoltage control to by-pass the synchrocheck measurements (dead source function).

• **SYNCHK1 V1 SOURCE**: This setting selects the source for voltage V1 (see NOTES below).

• **SYNCHK1 V2 SOURCE**: This setting selects the source for voltage V2, which must not be the same as used for the V1 (see NOTES below).

• **SYNCHK1 MAX VOLT DIFF**: This setting selects the maximum primary voltage difference in volts between the two sources. A primary voltage magnitude difference between the two input voltages below this value is within the permissible limit for synchronism.

• **SYNCHK1 MAX ANGLE DIFF:** This setting selects the maximum angular difference in degrees between the two sources. An angular difference between the two input voltage phasors below this value is within the permissible limit for synchronism.

• **SYNCHK1 MAX FREQ DIFF:** This setting selects the maximum frequency difference in 'Hz' between the two sources. A frequency difference between the two input voltage systems below this value is within the permissible limit for synchronism.

• **SYNCHK1 MAX FREQ HYSTERESIS**: This setting specifies the required hysteresis for the maximum frequency difference condition. The condition becomes satisfied when the frequency difference becomes lower than **SYNCHK1 MAX FREQ DIFF**. Once the Synchrocheck element has operated, the frequency difference must increase above the **SYNCHK1 MAX FREQ DIFF + SYNCHK1 MAX FREQ HYSTERESIS** sum to drop out (assuming the other two conditions, voltage and angle, remain satisfied).

• **SYNCHK1 DEAD SOURCE SELECT:** This setting selects the combination of dead and live sources that will by-pass synchronism check function and permit the breaker to be closed when one or both of the two voltages (V1 or/and V2) are below the maximum voltage threshold. A dead or live source is declared by monitoring the voltage level. Six options are available:

None:	Dead Source function is disabled
LV1 and DV2:	Live V1 and Dead V2
DV1 and LV2:	Dead V1 and Live V2
DV1 or DV2:	Dead V1 or Dead V2
DV1 Xor DV2:	Dead V1 exclusive-or Dead V2 (one source is Dead and the other is Live)
DV1 and DV2:	Dead V1 and Dead V2

• **SYNCHK1 DEAD V1 MAX VOLT:** This setting establishes a maximum voltage magnitude for V1 in 1 'pu'. Below this magnitude, the V1 voltage input used for synchrocheck will be considered "Dead" or de-energized.

• **SYNCHK1 DEAD V2 MAX VOLT**: This setting establishes a maximum voltage magnitude for V2 in 'pu'. Below this magnitude, the V2 voltage input used for synchrocheck will be considered "Dead" or de-energized.

• **SYNCHK1 LIVE V1 MIN VOLT**: This setting establishes a minimum voltage magnitude for V1 in 'pu'. Above this magnitude, the V1 voltage input used for synchrocheck will be considered "Live" or energized.

• **SYNCHK1 LIVE V2 MIN VOLT**: This setting establishes a minimum voltage magnitude for V2 in 'pu'. Above this magnitude, the V2 voltage input used for synchrocheck will be considered "Live" or energized.

Notes on the Synchrocheck Function:

1. The selected sources for synchrocheck inputs V1 and V2 (which must not be the same source) may include both a three-phase and an auxiliary voltage. The relay will automatically select the specific voltages to be used by the synchrocheck element in accordance with the following table.

NO.	V1 OR V2 (SOURCE Y)	V2 OR V1 (SOURCE Z)	AUTO-SELECTED COMBINATION		AUTO-SELECTED VOLTAGE
			SOURCE Y	SOURCE Z	
1	Phase VTs and Auxiliary VT	Phase VTs and Auxiliary VT	Phase	Phase	VAB
2	Phase VTs and Auxiliary VT	Phase VT	Phase	Phase	VAB
3	Phase VT	Phase VT	Phase	Phase	VAB

NO.	V1 OR V2 (SOURCE Y)	V2 OR V1 (SOURCE Z)	AUTO-SELECTED COMBINATION		AUTO-SELECTED VOLTAGE
			SOURCE Y	SOURCE Z	
4	Phase VT and Auxiliary VT	Auxiliary VT	Phase	Auxiliary	V auxiliary (as set for Source z)
5	Auxiliary VT	Auxiliary VT	Auxiliary	Auxiliary	V auxiliary (as set for selected sources)

The voltages V1 and V2 will be matched automatically so that the corresponding voltages from the two sources will be used to measure conditions. A phase to phase voltage will be used if available in both sources; if one or both of the Sources have only an auxiliary voltage, this voltage will be used. For example, if an auxiliary voltage is programmed to VAG, the synchrocheck element will automatically select VAG from the other source. If the comparison is required on a specific voltage, the user can externally connect that specific voltage to auxiliary voltage terminals and then use this "Auxiliary Voltage" to check the synchronism conditions.

If using a single CT/VT module with both phase voltages and an auxiliary voltage, ensure that <u>only</u> the auxiliary voltage is programmed in one of the sources to be used for synchrocheck.

> **NOTE**
> ***Exception: Synchronism cannot be checked between Delta connected phase VTs and a Wye connected auxiliary voltage.***

2. The relay measures frequency and Volts/Hz from an input on a given source with priorities as established by the configuration of input channels to the source. The relay will use the phase channel of a three-phase set of voltages if programmed as part of that source. The relay will use the auxiliary voltage channel only if that channel is programmed as part of the Source and a three-phase set is not.

The autoreclose scheme is intended for use on transmission lines with circuit breakers operated in both the single pole and three pole modes, in one or two breaker arrangements. The autoreclose scheme provides four programs with different operating cycles, depending on the fault type. Each of the four programs can be set to trigger up to four reclosing attempts. The second, third, and fourth attempts always perform three-pole reclosing and have independent dead time delays.

When used in two breaker applications, the reclosing sequence is selectable. The reclose signal can be sent to one selected breaker only, to both breakers simultaneously or to both breakers in sequence (one breaker first and then, after a delay to check that the reclose was successful, to the second breaker). When reclosing in sequence, the first breaker should reclose with either the single-pole or three-pole dead time according to the fault type and reclose mode; the second breaker should follow the successful reclosure of the first breaker. When reclosing simultaneously, for the first shot both breakers should reclose with either the single-pole or three-pole dead time, according to the fault type and the reclose mode.

The signal used to initiate the autoreclose scheme is the trip output from protection. This signal can be single pole tripping for single phase faults and three phase tripping for multi-phase faults. The autoreclose scheme has five operating states.

STATE	CHARACTERISTICS
Enabled	Scheme is permitted to operate
Disabled	Scheme is not permitted to operate
Reset	Scheme is permitted to operate and shot count is reset to 0
Reclose in progress	Scheme has been initiated but the reclose cycle is not finished (successful or not)
Lockout	Scheme is not permitted to operate until reset received

AR PROGRAMS:

The autorecloser provides four programs that can cause from one to four reclose attempts (shots). After the first shot, all subsequent recloses will always be three-pole. If the maximum number of shots selected is "1" (only one reclose attempt) and the fault is persistent, after the first reclose the scheme will go to lockout upon another Initiate signal.

For the 3-pole reclose programs (modes 3 and 4), an AR FORCE 3-P FlexLogic™ operand is set. This operand can be used in connection with the tripping logic to cause a three-pole trip for single-phase faults.

Table 5–19: AUTORECLOSE PROGRAMS

MODE	AR MODE	FIRST SHOT		SECOND SHOT		THIRD SHOT		FOURTH SHOT	
		SINGLE-PHASE FAULT	MULTI-PHASE FAULT	SINGLE-PHASE FAULT	MULTI-PHASE FAULT	SINGLE-PHASE FAULT	MULTI-PHASE FAULT	SINGLE-PHASE FAULT	MULTI-PHASE FAULT
1	1 & 3 POLE	1 POLE	3 POLE	3 POLE or LO	3 POLE or LO	3 POLE or LO	3 POLE or LO	3 POLE or LO	3 POLE or LO
2	1 POLE	1 POLE	LO	3 POLE or LO	3 POLE or LO	3 POLE or LO	3 POLE or LO	3 POLE or LO	3 POLE or LO
3	3 POLE-A	3 POLE	LO	3 POLE or LO	LO	3 POLE or LO	LO	3 POLE or LO	LO
4	3 POLE-B	3 POLE	3 POLE	3 POLE or LO	3 POLE or LO	3 POLE or LO	3 POLE or LO	3 POLE or LO	3 POLE or LO

The four autoreclose modes are described below:

1. "1 & 3 Pole": In this mode, the autorecloser starts the **AR 1-P DEAD TIME** timer for the first shot if the autoreclose is single-phase initiated, the **AR 3-P DEAD TIME 1** timer if the autoreclose is three-pole initiated, and the **AR 3-P DEAD TIME 2** timer if the autoreclose is three-phase time delay initiated. If two or more shots are enabled, the second, third, and fourth shots are always three-pole and start the **AR 3-P DEAD TIME 2(4)** timers.

2. "1 Pole": In this mode, the autorecloser starts the **AR 1-P DEAD TIME** for the first shot if the fault is single phase. If the fault is three-phase *or a three-pole trip on the breaker occurred during the single-pole initiation*, the scheme goes to lockout without reclosing. If two or more shots are enabled, the second, third, and fourth shots are always three-pole and start the **AR 3-P DEAD TIME 2(4)** timers.

3. "3 Pole-A": In this mode, the autorecloser is initiated only for single phase faults, although the trip is three pole. The autorecloser uses the **AR 3-P DEAD TIME 1** for the first shot if the fault is single phase. If the fault is multi phase the scheme will go to Lockout without reclosing. If two or more shots are enabled, the second, third, and fourth shots are always three-phase and start the **AR 3-P DEAD TIME 2(4)** timers.

4. "3 Pole-B": In this mode, the autorecloser is initiated for any type of fault and starts the **AR 3-P DEAD TIME 1** for the first shot. If the initiating signal is **AR 3P TD INIT** the scheme starts **AR 3-P DEAD TIME 2** for the first shot. If two or more shots are enabled, the second, third, and fourth shots are always three-phase and start the **AR 3-P DEAD TIME 2(4)** timers.

BASIC RECLOSING OPERATION:

Reclosing operation is determined primarily by the **AR MODE** and **AR BKR SEQUENCE** settings. The reclosing sequences are started by the initiate inputs. A reclose initiate signal will send the scheme into the reclose-in-progress (RIP) state, asserting the AR RIP FlexLogic™ operand. The scheme is latched into the RIP state and resets only when an AR CLS BKR 1 (autore-close breaker 1) or AR CLS BKR 2 (autoreclose breaker 2) operand is generated or the scheme goes to the Lockout state.

The dead time for the initial reclose operation will be determined by either the **AR 1-P DEAD TIME**, **AR 3-P DEAD TIME 1**, or **AR 3-P DEAD TIME 2** setting, depending on the fault type and the mode selected. After the dead time interval the scheme will assert the AR CLOSE BKR 1 or AR CLOSE BKR 2 operands, as determined by the sequence selected. These operands are latched until the breaker closes or the scheme goes to Reset or Lockout.

There are three initiate programs: single pole initiate, three pole initiate and three pole, time delay initiate. Any of these reclose initiate signals will start the reclose cycle and set the reclose-in-progress (AR RIP) operand. The reclose-in-progress operand is sealed-in until the Lockout or Reset signal appears.

The three-pole initiate and three-pole time delay initiate signals are latched until the CLOSE BKR1 OR BKR2 or Lockout or Reset signal appears.

AR PAUSE:

The pause input offers the possibility of freezing the autoreclose cycle until the pause signal disappears. This may be done when a trip occurs and simultaneously or previously, some conditions are detected such as out-of step or loss of guard frequency, or a remote transfer trip signal is received. The pause signal blocks all three dead timers. When the 'pause' signal disappears the autoreclose cycle is resumed by initiating **AR 3-P DEAD TIME 2**.

This feature can be also used when a transformer is tapped from the protected line and a reclose is not desirable until the transformer is removed from the line. In this case, the reclose scheme is 'paused' until the transformer is disconnected. The **AR PAUSE** input will force a three-pole trip through the **3-P DEADTIME 2** path.

EVOLVING FAULTS:

1.25 cycles after the single pole dead time has been initiated, the AR FORCE 3P TRIP operand is set and it will be reset only when the scheme is reset or goes to Lockout. This will ensure that when a fault on one phase evolves to include another phase during the single pole dead time of the auto-recloser the scheme will force a 3 pole trip and reclose.

RECLOSING SCHEME OPERATION FOR ONE BREAKER:

- **Permanent Fault**: Consider Mode 1, which calls for 1-Pole or 3-Pole Time Delay 1 for the first reclosure and 3-Pole Time Delay 2 for the second reclosure, and assume a permanent fault on the line. Also assume the scheme is in the Reset state. For the first single-phase fault the **AR 1-P DEAD TIME** timer will be started, while for the first multi-phase fault the **AR 3-P DEAD TIME 1** timer will be started. If the **AR 3P TD INIT** signal is high, the **AR 3-P DEAD TIME 2** will be started for the first shot.

  If **AR MAX NO OF SHOTS** is set to "1", upon the first reclose the shot counter is set to 1. Upon reclosing, the fault is again detected by protection and reclose is initiated. The breaker is tripped three-pole through the AR SHOT COUNT >0 operand that will set the AR FORCE 3P operand. Because the shot counter has reached the maximum number of shots permitted the scheme is sent to the Lockout state.

  If **AR MAX NO OF SHOTS** is set to "2", upon the first reclose the shot counter is set to 1. Upon reclosing, the fault is again detected by protection and reclose is initiated. The breaker is tripped three-pole through the AR SHOT COUNT >0 operand that will set the AR FORCE 3P operand. After the second reclose the shot counter is set to 2. Upon reclosing, the fault is again detected by protection, the breaker is tripped three-pole, and reclose is initiated again. Because the shot counter has reached the maximum number of shots permitted the scheme is sent to the lockout state.

- **Transient Fault**: When a reclose output signal is sent to close the breaker the reset timer is started. If the reclosure sequence is successful (there is no initiating signal and the breaker is closed) the reset timer will time out returning the scheme to the reset state with the shot counter set to "0" making it ready for a new reclose cycle.

RECLOSING SCHEME OPERATION FOR TWO BREAKERS:

- **Permanent Fault**: The general method of operation is the same as that outlined for the one breaker applications except for the following description, which assumes **AR BKR SEQUENCE** is "1-2" (reclose Breaker 1 before Breaker 2) The signal output from the dead time timers passes through the breaker selection logic to initiate reclosing of Breaker 1. The Close Breaker 1 signal will initiate the Transfer Timer. After the reclose of the first breaker the fault is again detected by the protection, the breaker is tripped three pole and the autoreclose scheme is initiated. The Initiate signal will stop the transfer timer. After the 3-P dead time times out the Close Breaker 1 signal will close first breaker again and will start the transfer timer. Since the fault is permanent the protection will trip again initiating the autoreclose scheme that will be sent to Lockout by the SHOT COUNT = MAX signal.

- **Transient Fault**: When the first reclose output signal is sent to close Breaker 1, the reset timer is started. The close Breaker 1 signal initiates the transfer timer that times out and sends the close signal to the second breaker. If the reclosure sequence is successful (both breakers closed and there is no initiating signal) the reset timer will time out, returning the scheme to the reset state with the shot counter set to 0. The scheme will be ready for a new reclose cycle.

AR BKR1(2) RECLS FAIL:

If the selected sequence is "1–2" or "2–1" and after the first or second reclose attempt the breaker fails to close, there are two options. If the **AR BKR 1(2) FAIL OPTION** is set to "Lockout", the scheme will go to lockout state. If the **AR BKR 1(2) FAIL OPTION** is set to "Continue", the reclose process will continue with Breaker 2. At the same time the shot counter will be decreased (since the closing process was not completed).

SCHEME RESET AFTER RECLOSURE:

When a reclose output signal is sent to close either breaker 1 or 2 the reset timer is started. If the reclosure sequence is successful (there is no initiating signal and the breakers are closed) the reset timer will time out, returning the scheme to the reset state, with the shot counter set to 0, making it ready for a new reclose cycle.

In two breaker schemes, if one breaker is in the out-of-service state and the other is closed at the end of the reset time, the scheme will also reset. If at the end of the reset time at least one breaker, which is not in the out-of-service state, is open the scheme will be sent to Lockout.

The reset timer is stopped if the reclosure sequence is not successful: an initiating signal present or the scheme is in Lockout state. The reset timer is also stopped if the breaker is manually closed or the scheme is otherwise reset from lockout.

LOCKOUT:

When a reclose sequence is started by an initiate signal the scheme moves into the reclose-in-progress state and starts the incomplete sequence timer. The setting of this timer determines the maximum time interval allowed for a single reclose shot. If a close breaker 1 or 2 signal is not present before this time expires, the scheme goes to "Lockout".

There are four other conditions that can take the scheme to the Lockout state, as shown below:

*   Receipt of 'Block' input while in the reclose-in-progress state
*   The reclosing program logic: when a 3P Initiate is present and the autoreclose mode is either 1 Pole or 3Pole-A (3 pole autoreclose for single pole faults only)
*   Initiation of the scheme when the count is at the maximum allowed
*   If at the end of the reset time at least one breaker, which is not in the out-of-service state, is open the scheme will be sent to Lockout. The scheme will be also sent to Lockout if one breaker fails to reclose and the setting **AR BKR FAIL OPTION** is set to "Lockout".

Once the Lockout state is set it will be latched until one or more of the following occurs:

*   The scheme is intentionally reset from Lockout, employing the Reset setting of the Autorecloser;
*   The Breaker(s) is(are) manually closed from panel switch, SCADA or other remote control through the **AR BRK MAN CLOSE** setting;
*   10 seconds after breaker control detects that breaker(s) were closed.

BREAKER OPEN BEFORE FAULT:

A logic circuit is provided that inhibits the close breaker 1 and close breaker 2 outputs if a reclose initiate (RIP) indicator is not present within 30 ms of the Breaker Any Phase Open input. This feature is intended to prevent reclosing if one of the breakers was open in advance of a reclose initiate input to the recloser. This logic circuit resets when the breaker is closed.

TRANSFER RECLOSE WHEN BREAKER IS BLOCKED:

1. When the reclosing sequence 1-2 is selected and Breaker 1 is blocked (AR BKR1 BLK operand is set) the reclose signal can be transferred direct to the Breaker 2 if **AR TRANSFER 1 TO 2** is set to "Yes". If set to "No", the scheme will be sent to Lockout by the incomplete sequence timer.

2. When the reclosing sequence 2-1 is selected and Breaker 2 is blocked (AR BKR2 BLK operand is set) the reclose signal can be transferred direct to the Breaker 1 if **AR TRANSFER 2 TO 1** is set to "Yes". If set to "No" the scheme will be sent to Lockout by the incomplete sequence timer.

FORCE 3-POLE TRIPPING:

The reclosing scheme contains logic that is used to signal trip logic that three-pole tripping is required for certain conditions. This signal is activated by any of the following:

*   Autoreclose scheme is paused after it was initiated.
*   Autoreclose scheme is in the lockout state.

- Autoreclose mode is programmed for three-pole operation

- The shot counter is not at 0; that is, the scheme is not in the reset state. This ensures a second trip will be three-pole when reclosing onto a permanent single phase fault.

- 1.25 cycles after the single-pole reclose is initiated by the AR 1P INIT signal.

ZONE 1 EXTENT:

The zone 1 extension philosophy here is to apply an overreaching zone permanently as long as the relay is ready to reclose, and reduce the reach when reclosing. Another zone 1 extension approach is to operate normally from an underreaching zone, and use an overreaching distance zone when reclosing the line with the other line end open. This philosophy could be programmed via the line pickup scheme.

The "Extended Zone 1" is 0 when autoreclose is in lockout or disabled and 1 when autoreclose is in reset.

1. When "Extended Zone 1" is 0, the distance functions shall be set to normal underreach Zone 1 setting.

2. When "Extended Zone 1" is 1, the distance functions may be set to Extended Zone 1 Reach, which is an overreaching setting.

3. During a reclose cycle, "Extended Zone 1" goes to 0 as soon as the first CLOSE BREAKER signal is issued (AR SHOT COUNT > 0) and remains 0 until the recloser goes back to reset.

USE OF SETTINGS:

The single-phase autoreclose settings are described below.

- **AR MODE**: This setting selects the Autoreclose operating mode, which functions in conjunction with signals received at the initiation inputs as described previously.

- **AR MAX NUMBER OF SHOTS**: This setting specifies the number of reclosures that can be attempted before reclosure goes to lockout when the fault is permanent.

- **AR BLOCK BKR1**: This input selects an operand that will block the reclose command for breaker 1. This condition can be for example: breaker low air pressure, reclose in progress on another line (for the central breaker in a breaker and a half arrangement), or a sum of conditions combined in FlexLogic™.

- **AR CLOSE TIME BKR1**:This setting represents the closing time for the breaker 1 from the moment the "Close" command is sent to the moment the contacts are closed.

- **AR BKR MAN CLOSE:** This setting selects a FlexLogic™ operand that represents manual close command to a breaker associated with the autoreclose scheme.

- **AR BLK TIME UPON MAN CLS**: The autoreclose scheme can be disabled for a programmable time delay after an associated circuit breaker is manually commanded to close, preventing reclosing onto an existing fault such as grounds on the line. This delay must be longer than the slowest expected trip from any protection not blocked after manual closing. If the autoreclose scheme is not initiated after a manual close and this time expires the autoreclose scheme is set to the reset state.

- **AR 1P INIT**: This setting selects a FlexLogic™ operand that is intended to initiate single-pole autoreclosure.

- **AR 3P INIT**: This setting selects a FlexLogic™ operand that is intended to initiate three-pole autoreclosure, first timer (AR 3P DEAD TIME 1) that can be used for a high-speed autoreclosure.

- **AR 3P TD INIT**: This setting selects a FlexLogic™ operand intended to initiate three-pole autoreclosure. second timer (AR 3P DEAD TIME 2) can be used for a time-delay autoreclosure.

- **AR MULTI-P FAULT:** This setting selects a FlexLogic™ operand that indicates a multi-phase fault. The operand value should be zero for single-phase to ground faults.

- **BKR ONE POLE OPEN:** This setting selects a FlexLogic™ operand which indicates that the breaker has opened correctly following a single phase to ground fault and the autoreclose scheme can start timing the single pole dead time (for 1-2 reclose sequence for example, breaker 1 should trip single pole and breaker 2 should trip 3 pole).

  The scheme has a pre-wired input that indicates breaker status.

- **BKR 3 POLE OPEN:** This setting selects a FlexLogic™ operand which indicates that the breaker has opened three pole and the autoreclose scheme can start timing the three pole dead time. The scheme has a pre-wired input that indicates breaker status.

- **AR 3-P DEAD TIME 1**: This is the dead time following the first three pole trip. This intentional delay can be used for a high-speed three-pole autoreclose. However, it should be set longer than the estimated de-ionizing time following the three-pole trip.

- **AR 3-P DEAD TIME 2**: This is the dead time following the second three-pole trip or initiated by the AR 3P TD INIT input. This intentional delay is typically used for a time delayed three-pole autoreclose (as opposed to high speed three-pole autoreclose).

- **AR 3-P DEAD TIME 3(4)**: These settings represent the dead time following the third (fourth) three-pole trip.

- **AR EXTEND DEAD T 1**: This setting selects an operand that will adapt the duration of the dead time for the first shot to the possibility of non-simultaneous tripping at the two line ends. Typically this is the operand set when the communication channel is out of service

- **AR DEAD TIME 1 EXTENSION**: This timer is used to set the length of the dead time 1 extension for possible non-simultaneous tripping of the two ends of the line.

- **AR RESET**: This setting selects the operand that forces the autoreclose scheme from any state to reset. Typically this is a manual reset from lockout, local or remote.

- **AR RESET TIME**: A reset timer output resets the recloser following a successful reclosure sequence. The setting is based on the breaker time which is the minimum time required between successive reclose sequences.

- **AR BKR CLOSED:** This setting selects an operand that indicates that the breakers are closed at the end of the reset time and the scheme can reset.

- **AR BLOCK**: This setting selects the operand that blocks the autoreclose scheme (it can be a sum of conditions such as: time delayed tripping, breaker failure, bus differential protection, etc.). If the block signal is present before autoreclose scheme initiation the AR DISABLED FlexLogic™ operand will be set. If the block signal occurs when the scheme is in the RIP state the scheme will be sent to lockout.

- **AR PAUSE**: The pause input offers the ability to freeze the autoreclose cycle until the pause signal disappears. This may be done when a trip occurs and simultaneously or previously, some conditions are detected such as out-of step or loss of guard frequency, or a remote transfer trip signal is received. When the *pause signal* disappears the autoreclose cycle is resumed. This feature can also be used when a transformer is tapped from the protected line and a reclose is not desirable until the it is disconnected from the line. In this situation, the reclose scheme is *paused* until the transformer is disconnected.

- **AR INCOMPLETE SEQ TIME**: This timer is used to set the maximum time interval allowed for a single reclose shot. It is started whenever a reclosure is initiated and is active until the CLOSE BKR1 or CLOSE BKR2 signal is sent. If all conditions allowing a breaker closure are not satisfied when this time expires, the scheme goes to "Lockout". The minimum permissible setting is established by the **AR 3-P DEAD TIME 2** timer setting. Settings beyond this will determine the *wait time* for the breaker to open so that the reclose cycle can continue and/or for the AR PAUSE signal to reset and allow the reclose cycle to continue and/or for the AR BKR1 BLK signal to disappear and allow the AR CLOSE BKR1 signal to be sent.

- **AR BLOCK BKR2**: This input selects an operand that will block the reclose command for breaker 2. This condition can be for example: breaker low air pressure, reclose in progress on another line (for the central breaker in a breaker and a half arrangement), or a sum of conditions combined in FlexLogic™.

- **AR CLOSE TIME BKR2**: This setting represents the closing time for the breaker 2 from the moment the 'Close' command is sent to the moment the contacts are closed.

- **AR TRANSFER 1 TO 2**: This setting establishes how the scheme performs when the breaker closing sequence is 1-2 and breaker 1 is blocked. When set to "Yes" the closing command will be transferred direct to breaker 2 without waiting the transfer time. When set to "No" the closing command will be blocked by the AR BKR1 BLK signal and the scheme will be sent to lockout by the incomplete sequence timer.

- **AR TRANSFER 2 TO 1**: This setting establishes how the scheme performs when the breaker closing sequence is 2-1 and breaker 2 is blocked. When set to "Yes" the closing command will be transferred direct to breaker 1 without waiting the transfer time. When set to "No", the closing command will be blocked by the AR BKR2 BLK signal and the scheme will be sent to lockout by the incomplete sequence timer.

- **AR BKR1 FAIL OPTION**: This setting establishes how the scheme performs when the breaker closing sequence is 1-2 and Breaker 1 has failed to close. When set to "Continue" the closing command will be transferred to breaker 2 which will continue the reclosing cycle until successful (the scheme will reset) or unsuccessful (the scheme will go to Lockout). When set to "Lockout" the scheme will go to lockout without attempting to reclose breaker 2.

- **AR BKR2 FAIL OPTION**: This setting establishes how the scheme performs when the breaker closing sequence is 2-1 and Breaker 2 has failed to close. When set to "Continue" the closing command will be transferred to breaker 1 which will continue the reclosing cycle until successful (the scheme will reset) or unsuccessful (the scheme will go to Lockout). When set to "Lockout" the scheme will go to lockout without attempting to reclose breaker 1.

- **AR 1-P DEAD TIME**: Set this intentional delay longer than the estimated de-ionizing time after the first single-pole trip.

- **AR BREAKER SEQUENCE**: This setting selects the breakers reclose sequence: Select "1" for reclose breaker 1 only, "2" for reclose breaker 2 only, "1&2" for reclose both breakers simultaneously, "1-2" for reclose breakers sequentially; Breaker 1 first, and "2-1" for reclose breakers sequentially; Breaker 2 first.

- **AR TRANSFER TIME**: The transfer time is used only for breaker closing sequence 1-2 or 2-1, when the two breakers are reclosed sequentially. The transfer timer is initiated by a close signal to the first breaker. The transfer timer transfers the reclose signal from the breaker selected to close first to the second breaker. The time delay setting is based on the maximum time interval between the autoreclose signal and the protection trip contact closure assuming a permanent fault (unsuccessful reclose). Therefore, the minimum setting is equal to the maximum breaker closing time plus the maximum line protection operating time plus a suitable margin. This setting will prevent the autoreclose scheme from transferring the close signal to the second breaker unless a successful reclose of the first breaker occurs.

- **AR BUS FLT INIT**: This setting is used in breaker-and-a-half applications to allow the autoreclose control function to perform reclosing with only *one* breaker previously opened by bus protection. For line faults, both breakers must open for the autoreclose reclosing cycles to take effect.

MESSAGE	▲	DIGITAL ELEMENT 1 EVENTS: Disabled	Range: Disabled, Enabled

There are 48 identical digital elements available, numbered 1 to 48. A digital element can monitor any FlexLogic™ operand and present a target message and/or enable events recording depending on the output operand state. The digital element settings include a name which will be referenced in any target message, a blocking input from any selected FlexLogic™ operand, and a timer for pickup and reset delays for the output operand.

- **DIGITAL ELEMENT 1 INPUT:** Selects a FlexLogic™ operand to be monitored by the digital element.

- **DIGITAL ELEMENT 1 PICKUP DELAY:** Sets the time delay to pickup. If a pickup delay is not required, set to "0".

- **DIGITAL ELEMENT 1 RESET DELAY:** Sets the time delay to reset. If a reset delay is not required, set to "0".

- **DIGITAL ELEMENT 1 PICKUP LED**: This setting enables or disabled the digital element pickup LED. When set to "Disabled", the operation of the pickup LED is blocked.
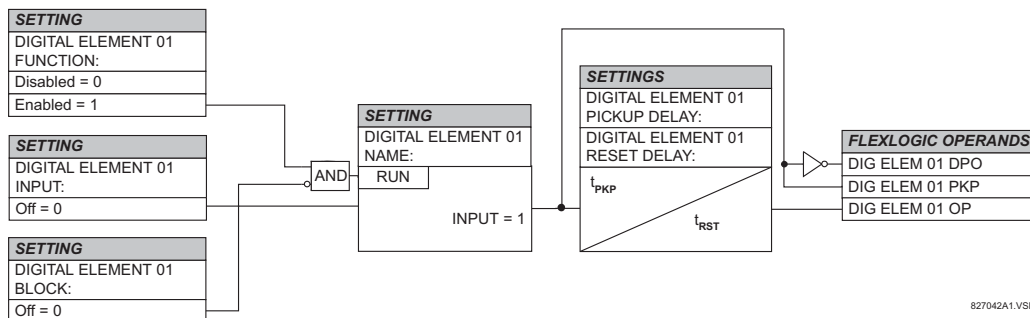

Figure 5–76: DIGITAL ELEMENT SCHEME LOGIC

CIRCUIT MONITORING APPLICATIONS:

Some versions of the digital input modules include an active voltage monitor circuit connected across form-A contacts. The voltage monitor circuit limits the trickle current through the output circuit (see technical specifications for form-A).

As long as the current through the voltage monitor is above a threshold (see technical specifications for form-A), the Flex-Logic™ operand "Cont Op # VOn" will be set (# represents the output contact number). If the output circuit has a high resistance or the DC current is interrupted, the trickle current will drop below the threshold and the FlexLogic™ operand "Cont Op # VOff" will be set. Consequently, the state of these operands can be used as indicators of the integrity of the circuits in which Form-A contacts are inserted.

EXAMPLE 1: BREAKER TRIP CIRCUIT INTEGRITY MONITORING

In many applications it is desired to monitor the breaker trip circuit integrity so problems can be detected before a trip operation is required. The circuit is considered to be healthy when the voltage monitor connected across the trip output contact detects a low level of current, well below the operating current of the breaker trip coil. If the circuit presents a high resistance, the trickle current will fall below the monitor threshold and an alarm would be declared.

In most breaker control circuits, the trip coil is connected in series with a breaker auxiliary contact which is open when the breaker is open (see diagram below). To prevent unwanted alarms in this situation, the trip circuit monitoring logic must include the breaker position.
Figure 5–77: TRIP CIRCUIT EXAMPLE 1

Assume the output contact H1 is a trip contact. Using the contact output settings, this output will be given an ID name, e.g. "Cont Op 1". Assume a 52a breaker auxiliary contact is connected to contact input H7a to monitor breaker status. Using the contact input settings, this input will be given an ID name, e.g. "Cont Ip 1" and will be set "On" when the breaker is closed. The settings to use digital element 1 to monitor the breaker trip circuit are indicated below (EnerVista UR Setup example shown):

PARAMETER	DIGITAL ELEMENT 1
Function	Enabled
Digital Element 1 Name	Bkr Trip Cct Out
Input	Cont Op 1 VOff (H1)
Pickup Delay	0.200 s
Reset Delay	0.100 s
Pickup Led	Enabled
Block	Cont Ip 1 Off(H5a)
Target	Self-reset
Events	Enabled
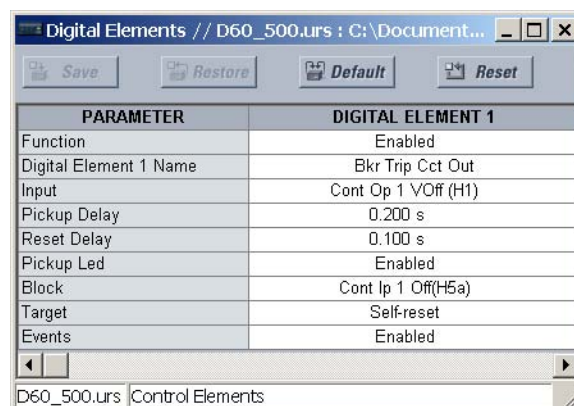

> **NOTE**
>
> The **PICKUP DELAY** setting should be greater than the operating time of the breaker to avoid nuisance alarms.

EXAMPLE 2: BREAKER TRIP CIRCUIT INTEGRITY MONITORING

If it is required to monitor the trip circuit continuously, independent of the breaker position (open or closed), a method to maintain the monitoring current flow through the trip circuit when the breaker is open must be provided (as shown in the figure below). This can be achieved by connecting a suitable resistor (see figure below) across the auxiliary contact in the trip circuit. In this case, it is not required to supervise the monitoring circuit with the breaker position – the **BLOCK** setting is selected to "Off". In this case, the settings are as follows (EnerVista UR Setup example shown).

PARAMETER	DIGITAL ELEMENT 1
Function	Enabled
Digital Element 1 Name	Bkr Trip Cct Out
Input	Cont Op 1 VOff (H1)
Pickup Delay	0.200 s
Reset Delay	0.100 s
Pickup Led	Enabled
Block	OFF
Target	Self-reset
Events	Enabled

PATH: SETTINGS ⇨⇩ CONTROL ELEMENTS ⇨⇩ DIGITAL COUNTERS ⇨ COUNTER 1(8)

Setting	Range
■ COUNTER 1 ■	
COUNTER 1 FUNCTION: Disabled	*Range: Disabled, Enabled*
COUNTER 1 NAME: Counter 1	*Range: 12 alphanumeric characters*
COUNTER 1 UNITS:	*Range: 6 alphanumeric characters*
COUNTER 1 PRESET: 0	*Range: –2,147,483,648 to +2,147,483,647*
COUNTER 1 COMPARE: 0	*Range: –2,147,483,648 to +2,147,483,647*
COUNTER 1 UP: Off	*Range: FlexLogic™ operand*
COUNTER 1 DOWN: Off	*Range: FlexLogic™ operand*
COUNTER 1 BLOCK: Off	*Range: FlexLogic™ operand*
CNT1 SET TO PRESET: Off	*Range: FlexLogic™ operand*
COUNTER 1 RESET: Off	*Range: FlexLogic™ operand*
COUNT1 FREEZE/RESET: Off	*Range: FlexLogic™ operand*
COUNT1 FREEZE/COUNT: Off	*Range: FlexLogic™ operand*

There are 8 identical digital counters, numbered from 1 to 8. A digital counter counts the number of state transitions from Logic 0 to Logic 1. The counter is used to count operations such as the pickups of an element, the changes of state of an external contact (e.g. breaker auxiliary switch), or pulses from a watt-hour meter.

- **COUNTER 1 UNITS:** Assigns a label to identify the unit of measure pertaining to the digital transitions to be counted. The units label will appear in the corresponding actual values status.

- **COUNTER 1 PRESET:** Sets the count to a required preset value before counting operations begin, as in the case where a substitute relay is to be installed in place of an in-service relay, or while the counter is running.

- **COUNTER 1 COMPARE:** Sets the value to which the accumulated count value is compared. Three FlexLogic™ output operands are provided to indicate if the present value is 'more than (HI)', 'equal to (EQL)', or 'less than (LO)' the set value.

- **COUNTER 1 UP:** Selects the FlexLogic™ operand for incrementing the counter. If an enabled UP input is received when the accumulated value is at the limit of +2,147,483,647 counts, the counter will rollover to –2,147,483,648.

- **COUNTER 1 DOWN:** Selects the FlexLogic™ operand for decrementing the counter. If an enabled DOWN input is received when the accumulated value is at the limit of –2,147,483,648 counts, the counter will rollover to +2,147,483,647.

- **COUNTER 1 BLOCK:** Selects the FlexLogic™ operand for blocking the counting operation. All counter operands are blocked.

- **CNT1 SET TO PRESET:** Selects the FlexLogic™ operand used to set the count to the preset value. The counter will be set to the preset value in the following situations:

  1. When the counter is enabled and the **CNT1 SET TO PRESET** operand has the value 1 (when the counter is enabled and **CNT1 SET TO PRESET** operand is 0, the counter will be set to 0).

  2. When the counter is running and the **CNT1 SET TO PRESET** operand changes the state from 0 to 1 (**CNT1 SET TO PRESET** changing from 1 to 0 while the counter is running has no effect on the count).

  3. When a reset or reset/freeze command is sent to the counter and the **CNT1 SET TO PRESET** operand has the value 1 (when a reset or reset/freeze command is sent to the counter and the **CNT1 SET TO PRESET** operand has the value 0, the counter will be set to 0).

- **COUNTER 1 RESET:** Selects the FlexLogic™ operand for setting the count to either "0" or the preset value depending on the state of the **CNT1 SET TO PRESET** operand.

- **COUNTER 1 FREEZE/RESET:** Selects the FlexLogic™ operand for capturing (freezing) the accumulated count value into a separate register with the date and time of the operation, and resetting the count to "0".

- **COUNTER 1 FREEZE/COUNT:** Selects the FlexLogic™ operand for capturing (freezing) the accumulated count value into a separate register with the date and time of the operation, and continuing counting. The present accumulated value and captured frozen value with the associated date/time stamp are available as actual values. If control power is interrupted, the accumulated and frozen values are saved into non-volatile memory during the power down operation.

There is one breaker arcing current element available per CT bank, with a minimum of two elements. This element calculates an estimate of the per-phase wear on the breaker contacts by measuring and integrating the current squared passing through the breaker contacts as an arc. These per-phase values are added to accumulated totals for each phase and compared to a programmed threshold value. When the threshold is exceeded in any phase, the relay can set an output operand to "1". The accumulated value for each phase can be displayed as an actual value.

The operation of the scheme is shown in the following logic diagram. The same output operand that is selected to operate the output relay used to trip the breaker, indicating a tripping sequence has begun, is used to initiate this feature. A time delay is introduced between initiation and the starting of integration to prevent integration of current flow through the breaker before the contacts have parted. This interval includes the operating time of the output relay, any other auxiliary relays and the breaker mechanism. For maximum measurement accuracy, the interval between change-of-state of the operand (from 0 to 1) and contact separation should be measured for the specific installation. Integration of the measured current continues for 100 ms, which is expected to include the total arcing period.

The feature is programmed to perform fault duration calculations. Fault duration is defined as a time between operation of the disturbance detector occurring before initiation of this feature, and reset of an internal low-set overcurrent function. Correction is implemented to account for a non-zero reset time of the overcurrent function.

Breaker arcing currents and fault duration values are available under the **ACTUAL VALUES** ⇨⇩ **RECORDS** ⇨⇩ **MAINTENANCE** ⇨ **BREAKER 1(4)** menus.

• **BKR 1 ARC AMP INT-A(C):** Select the same output operands that are configured to operate the output relays used to trip the breaker. In three-pole tripping applications, the same operand should be configured to initiate arcing current calculations for poles A, B and C of the breaker. In single-pole tripping applications, per-pole tripping operands should be configured to initiate the calculations for the poles that are actually tripped.

• **BKR 1 ARC AMP DELAY:** This setting is used to program the delay interval between the time the tripping sequence is initiated and the time the breaker contacts are expected to part, starting the integration of the measured current.

• **BKR 1 ARC AMP LIMIT:** Selects the threshold value above which the output operand is set.

The detection of the breaker flashover is based on the following condition:

1. Breaker open,
2. Voltage drop measured from either side of the breaker during the flashover period,
3. Voltage difference drop, and
4. Measured flashover current through the breaker.

Furthermore, the scheme is applicable for cases where either one or two sets of three-phase voltages are available across the breaker.

Three VT Breaker Flashover Application

When only one set of VTs is available across the breaker, the **BRK FLSHOVR SIDE 2 SRC** setting should be "None". To detect an open breaker condition in this application, the scheme checks if the per-phase voltages were recovered (picked up), the status of the breaker is open (contact input indicating the breaker status is off), and no flashover current is flowing. A contact showing the breaker status must be provided to the relay. The voltage difference will not be considered as a condition for open breaker in this part of the logic.

> **NOTE**
> **Voltages must be present prior to flashover conditions. If the three VTs are placed after the breaker on the line (or feeder), and the downstream breaker is open, the measured voltage would be zero and the flashover element will not be initiated.**

The flashover detection will reset if the current drops back to zero, the breaker closes, or the selected FlexLogic™ operand for supervision changes to high. Using supervision through the **BRK FLSHOVR SPV** setting is recommended by selecting a trip operand that will not allow the flashover element to pickup prior to the trip.

The flashover detection can be used for external alarm, re-tripping the breaker, or energizing the lockout relay.

Consider the following configuration:
The source 1 (SRC1) phase currents are feeder CTs and phase voltages are bus VTs, and Contact Input 1 is set as Breaker 52a contact. The conditions prior to flashover detection are:

1. 52a status = 0

2. VAg, VBg, or VCg is greater than the pickup setting

3. IA, IB, IC = 0; no current flows through the breaker

4. ΔVA is greater than pickup (not applicable in this scheme)

The conditions at flashover detection are:

1. 52a status = 0

2. VAg, VBg, or VCg is lower than the pickup setting

3. IA, IB, or IC is greater than the pickup current flowing through the breaker

4. ΔVA is greater than pickup (not applicable in this scheme)

Six VT Breaker Flashover Application

The per-phase voltage difference approaches zero when the breaker is closed. The is well below any typical minimum pickup voltage. Select the level of the **BRK 1(2) FLSHOVR DIFF V PKP** setting to be less than the voltage difference measured across the breaker when the close or open breaker resistors are left in service. Prior to flashover, the voltage difference is larger than **BRK 1(2) FLSHOVR DIFF V PKP**. This applies to either the difference between two live voltages per phase or when the voltage from one side of the breaker has dropped to zero (line de-energized), at least one per-phase voltage is larger than the **BRK 1(2) FLSHOVR V PKP** setting, and no current flows through the breaker poles. During breaker flashover, the per-phase voltages from both sides of the breaker drops below the pickup value defined by the **BRK 1(2) FLSHOVR V PKP** setting, the voltage difference drops below the pickup setting, and flashover current is detected. These flashover conditions initiate FlexLogic™ pickup operands and start the **BRK 1(2) FLSHOVR PKP DELAY** timer.

This application do not require detection of breaker status via a 52a contact, as it uses a voltage difference larger than the **BRK 1(2) FLSHOVR DIFF V PKP** setting. However, monitoring the breaker contact will ensure scheme stability.

Consider the following configuration:
The source 1 (SRC1) phase currents are CTs and phase voltages are bus VTs. The source 2 (SRC2) phase voltages are line VTs. Contact input 1 is set as the breaker 52a contact (optional).

The conditions prior to flashover detection are:

1.   ΔVA is greater than pickup

2.   VAg, VBg, or VCg is greater than the pickup setting

3.   IA, IB, IC = 0; no current flows through the breaker

4.   52a status = 0 (optional)

The conditions at flashover detection are:

1.   ΔVA is less than pickup

2.   VAg, VBg, or VCg is lower than the pickup setting

3.   IA, IB, or IC is greater than the pickup current flowing through the breaker

4.   52a status = 0 (optional)

> **NOTE**
>
> **The element is operational only when phase-to-ground voltages are connected to relay terminals. The flashover element will not operate if delta voltages are applied.**

The breaker flashover settings are described below.

- **BRK 1 FLSHOVR SIDE 1 SRC**: This setting specifies a signal source used to provide three-phase voltages and three-phase currents from one side of the current breaker. The source selected as a setting and must be configured with breaker phase voltages and currents, even if only three (3) VTs are available across the breaker.

- **BRK 1 FLSHOVR SIDE 2 SRC**: This setting specifies a signal source used to provide another set of three phase voltages whenever six (6) VTs are available across the breaker.

- **BRK 1 STATUS CLSD A** to **BRK 1 STATUS CLSD C**: These settings specify FlexLogic™ operands to indicate the open status of the breaker. A separate FlexLogic™ operand can be selected to detect individual breaker pole status and provide flashover detection. The recommended setting is 52a breaker contact or another operand defining the breaker poles open status.

- **BRK 1 FLSHOVR V PKP**: This setting specifies a pickup level for the phase voltages from both sides of the breaker. If six VTs are available, opening the breaker leads to two possible combinations – live voltages from only one side of the breaker, or live voltages from both sides of the breaker. Either case will set the scheme ready for flashover detection upon detection of voltage above the selected value. Set **BRK FLSHOVR V PKP** to 85 to 90% of the nominal voltage.

- **BRK 1 FLSHOVR DIFF V PKP**: This setting specifies a pickup level for the phase voltage difference when two VTs per phase are available across the breaker. The pickup voltage difference should be below the monitored voltage difference when close or open breaker resistors are left in service. The setting is selected as primary volts difference between the sources.

- **BRK 1 FLSHOVR AMP PKP**: This setting specifies the normal load current which can flow through the breaker. Depending on the flashover protection application, the flashover current can vary from levels of the charging current when the line is de-energized (all line breakers open), to well above the maximum line (feeder) load (line/feeder connected to load).

- **BRK 1 FLSHOVR SPV A** to **BRK 1 FLSHOVR SPV C**: These settings specifiy FlexLogic™ operands (per breaker pole) that supervise the operation of the element per phase. Supervision can be provided by operation of other protec-

tion elements, breaker failure, and close and trip commands. A six-cycle time delay applies after the selected Flex-Logic™ operand resets.

- **BRK FLSHOVR PKP DELAY**: This setting specifies the time delay to operate after a pickup condition is detected.

MESSAGE	⬆	BREAKER RESTRIKE 1 EVENTS: Disabled	*Range: Disabled, Enabled*

One breaker restrike element is provided for each CT/VT module in the C60.

According to IEEE standard C37.100: *IEEE Standard Definitions for Power Switchgear*, restrike is defined as "a resumption of current between the contacts of a switching device during an opening operation after an interval of zero current of ¼ cycle at normal frequency or longer".
Figure 5–83: TYPICAL RESTRIKE WAVEFORM AND DETECTION FLAG

The breakrer restrike algorithm responds to a successful interruption of the phase current following a declaration of capacitor bank offline as per the breaker pole indication. If a high-frequency current with a magnitude greater than the threshold is resumed at least ¼ of a cycle later than the phase current interruption, then a breaker restrike condition is declared in the corresponding phase and the BRK RESTRIKE 1 OP operand is asserted for a short period of time. The user can add counters and other logic to facilitate the decision making process as to the appropriate actions upon detecting a single restrike or a series of consecutive restrikes.

A restrike event (FlexLogic™ operand) is declared if all of the following hold:

- The current is initially interrupted.

- The breaker status is open.

- An elevated high frequency current condition occurs and the current subsequently drops out again.

The algorithm is illustrated in the state machine diagram shown below.
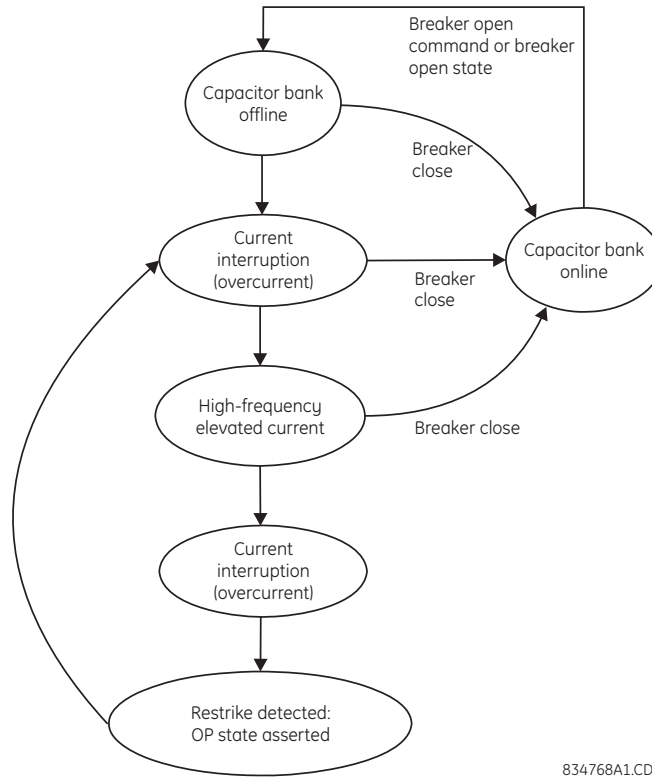

Figure 5–84: ALGORITHM ILLUSTRATION – STATE MACHINE TO DETECT RESTRIKE

In this way, a distinction is made between a self-extinguishing restrike and permanent breaker failure condition. The latter can be detected by the breaker failure function or a regular instantaneous overcurrent element. Also, a fast succession of restrikes will be picked up by breaker failure or instantaneous overcurrent protection.

The following settings are available for each element.

- **BREAKER RESTRIKE 1 FUNCTION**: This setting enable and disables operation of the breaker restrike detection element.

- **BRK RSTR 1 BLOCK**: This setting is used to block operation of the breaker restrike detection element.

- **BREAKER RESTRIKE 1 SOURCE**: This setting selects the source of the current for this element. This source must have a valid CT bank assigned.

- **BREAKER RESTRIKE 1 PICKUP**: This setting specifies the pickup level of the overcurrent detector in per-unit values of CT nominal current.

- **BREAKER RESTRIKE 1 RESET DELAY**: This setting specifies the reset delay for this element. When set to "0 ms", then FlexLogic™ operand will be picked up for only 1/8th of the power cycle.

- **BRK RSTR 1 BRK OPEN**: This setting assigns a FlexLogic™ operand indicating the open position of the breaker. It must be logic "1" when breaker is open.

- **BRK RSTR 1 OPEN CMD**: This setting assigns a FlexLogic™ operand indicating a breaker open command. It must be logic "1" when breaker is opened, either manually or from protection logic.

- **BRK RSTR 1 CLS CMD**: This setting assigns a FlexLogic™ operand indicating a breaker close command. It must be logic "1" when breaker is closed.
Figure 5–85: BREAKER RESTRIKE SCHEME LOGIC

e) VT FUSE FAILURE

PATH: SETTINGS ⇨⇩ CONTROL ELEMENTS ⇨⇩ MONITORING ELEMENTS ⇨⇩ VT FUSE FAILURE 1(4)

■ VT FUSE FAILURE 1 ■	◀▶	VT FUSE FAILURE 1 FUNCTION: Disabled	*Range: Disabled, Enabled*
Every signal source includes a fuse failure scheme.

The VT fuse failure detector can be used to raise an alarm and/or block elements that may operate incorrectly for a full or partial loss of AC potential caused by one or more blown fuses. Some elements that might be blocked (via the BLOCK input) are distance, voltage restrained overcurrent, and directional current.

There are two classes of fuse failure that may occur:

- Class A: loss of one or two phases.
- Class B: loss of all three phases.

Different means of detection are required for each class. An indication of Class A failures is a significant level of negative sequence voltage, whereas an indication of class B failures is when positive sequence current is present and there is an insignificant amount of positive sequence voltage. These noted indications of fuse failure could also be present when faults are present on the system, so a means of detecting faults and inhibiting fuse failure declarations during these events is provided. Once the fuse failure condition is declared, it will be sealed-in until the cause that generated it disappears.

An additional condition is introduced to inhibit a fuse failure declaration when the monitored circuit is de-energized; positive sequence voltage and current are both below threshold levels.

The function setting enables and disables the fuse failure feature for each source.
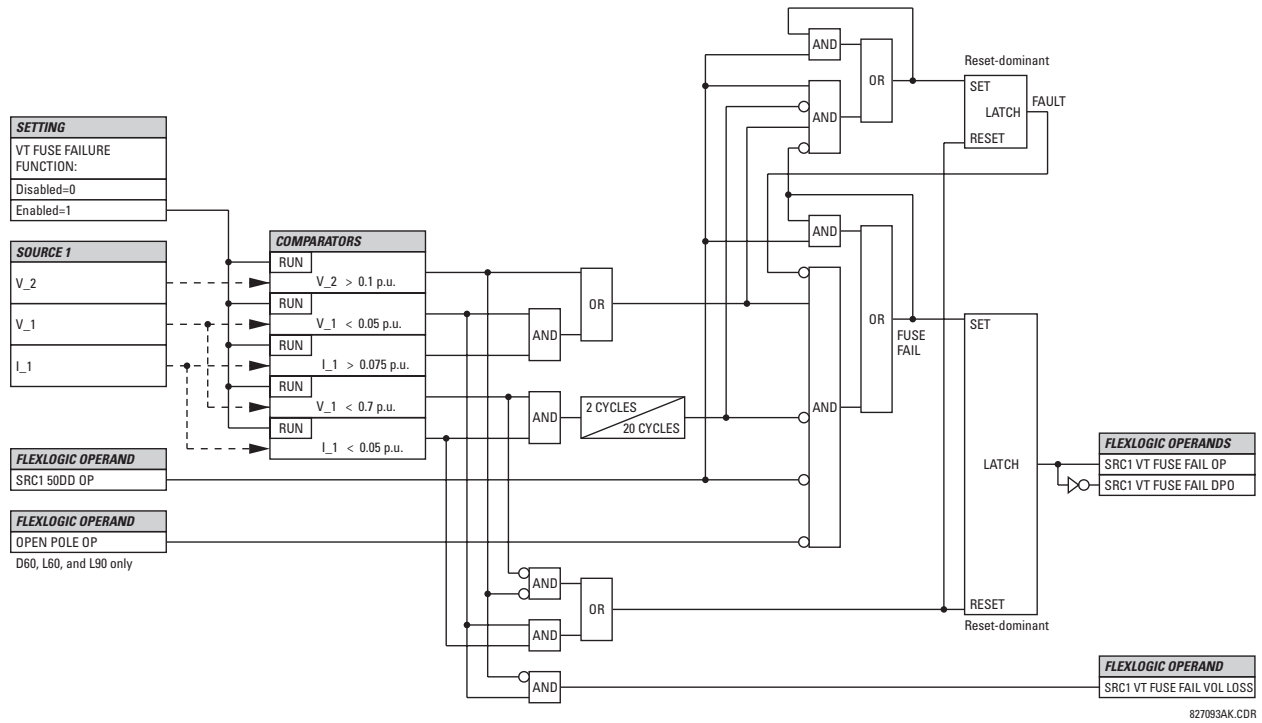

Figure 5–86: VT FUSE FAIL SCHEME LOGIC

MESSAGE	⬆	```TRIP BUS 1 EVENTS: Disabled```	*Range: Enabled, Disabled*

The trip bus element allows aggregating outputs of protection and control elements without using FlexLogic™ and assigning them a simple and effective manner. Each trip bus can be assigned for either trip or alarm actions. Simple trip conditioning such as latch, delay, and seal-in delay are available.

The easiest way to assign element outputs to a trip bus is through the EnerVista UR Setup software A protection summary is displayed by navigating to a specific protection or control protection element and checking the desired bus box. Once the desired element is selected for a specific bus, a list of element operate-type operands are displayed and can be assigned to a trip bus. If more than one operate-type operand is required, it may be assigned directly from the trip bus menu.

Figure 5–87: TRIP BUS FIELDS IN THE PROTECTION SUMMARY

The following settings are available.

- **TRIP BUS 1 BLOCK**: The trip bus output is blocked when the operand assigned to this setting is asserted.

- **TRIP BUS 1 PICKUP DELAY**: This setting specifies a time delay to produce an output depending on how output is used.

- **TRIP BUS 1 RESET DELAY**: This setting specifies a time delay to reset an output command. The time delay should be set long enough to allow the breaker or contactor to perform a required action.

- **TRIP BUS 1 INPUT 1** to **TRIP BUS 1 INPUT 16**: These settings select a FlexLogic™ operand to be assigned as an input to the trip bus.

- **TRIP BUS 1 LATCHING**: This setting enables or disables latching of the trip bus output. This is typically used when lockout is required or user acknowledgement of the relay response is required.

- **TRIP BUS 1 RESET**: The trip bus output is reset when the operand assigned to this setting is asserted. Note that the RESET OP operand is pre-wired to the reset gate of the latch, As such, a reset command the front panel interface or via communications will reset the trip bus output.

The contact inputs menu contains configuration settings for each contact input as well as voltage thresholds for each group of four contact inputs. Upon startup, the relay processor determines (from an assessment of the installed modules) which contact inputs are available and then display settings for only those inputs.

An alphanumeric ID may be assigned to a contact input for diagnostic, setting, and event recording purposes. The CONTACT IP X On" (Logic 1) FlexLogic™ operand corresponds to contact input "X" being closed, while CONTACT IP X Off corresponds to contact input "X" being open. The **CONTACT INPUT DEBNCE TIME** defines the time required for the contact to overcome 'contact bouncing' conditions. As this time differs for different contact types and manufacturers, set it as a maximum contact debounce time (per manufacturer specifications) plus some margin to ensure proper operation. If **CONTACT INPUT EVENTS** is set to "Enabled", every change in the contact input state will trigger an event.

A raw status is scanned for all Contact Inputs synchronously at the constant rate of 0.5 ms as shown in the figure below. The DC input voltage is compared to a user-settable threshold. A new contact input state must be maintained for a user-settable debounce time in order for the C60 to validate the new contact state. In the figure below, the debounce time is set at 2.5 ms; thus the 6th sample in a row validates the change of state (mark no. 1 in the diagram). Once validated (debounced), the contact input asserts a corresponding FlexLogic™ operand and logs an event as per user setting.

A time stamp of the first sample in the sequence that validates the new state is used when logging the change of the contact input into the Event Recorder (mark no. 2 in the diagram).

Protection and control elements, as well as FlexLogic™ equations and timers, are executed eight times in a power system cycle. The protection pass duration is controlled by the frequency tracking mechanism. The FlexLogic™ operand reflecting the debounced state of the contact is updated at the protection pass following the validation (marks no. 3 and 4 on the figure below). The update is performed at the beginning of the protection pass so all protection and control functions, as well as FlexLogic™ equations, are fed with the updated states of the contact inputs.

The FlexLogic™ operand response time to the contact input change is equal to the debounce time setting plus up to one protection pass (variable and depending on system frequency if frequency tracking enabled). If the change of state occurs just after a protection pass, the recognition is delayed until the subsequent protection pass; that is, by the entire duration of the protection pass. If the change occurs just prior to a protection pass, the state is recognized immediately. Statistically a delay of half the protection pass is expected. Owing to the 0.5 ms scan rate, the time resolution for the input contact is below 1msec.

For example, 8 protection passes per cycle on a 60 Hz system correspond to a protection pass every 2.1 ms. With a contact debounce time setting of 3.0 ms, the FlexLogic™ operand-assert time limits are: 3.0 + 0.0 = 3.0 ms and 3.0 + 2.1 = 5.1 ms. These time limits depend on how soon the protection pass runs after the debouncing time.

Regardless of the contact debounce time setting, the contact input event is time-stamped with a 1 μs accuracy using the time of the first scan corresponding to the new state (mark no. 2 below). Therefore, the time stamp reflects a change in the DC voltage across the contact input terminals that was not accidental as it was subsequently validated using the debounce timer. Keep in mind that the associated FlexLogic™ operand is asserted/de-asserted later, after validating the change.

The debounce algorithm is symmetrical: the same procedure and debounce time are used to filter the LOW-HIGH (marks no.1, 2, 3, and 4 in the figure below) and HIGH-LOW (marks no. 5, 6, 7, and 8 below) transitions.
Figure 5–89: INPUT CONTACT DEBOUNCING MECHANISM AND TIME-STAMPING SAMPLE TIMING

Contact inputs are isolated in groups of four to allow connection of wet contacts from different voltage sources for each group. The **CONTACT INPUT THRESHOLDS** determine the minimum voltage required to detect a closed contact input. This value should be selected according to the following criteria: 17 for 24 V sources, 33 for 48 V sources, 84 for 110 to 125 V sources and 166 for 250 V sources.

For example, to use contact input H5a as a status input from the breaker 52b contact to seal-in the trip relay and record it in the Event Records menu, make the following settings changes:

    CONTACT INPUT H5A ID: "Breaker Closed (52b)"
    CONTACT INPUT H5A EVENTS: "Enabled"

Note that the 52b contact is closed when the breaker is open and open when the breaker is closed.

```

There are 64 virtual inputs that can be individually programmed to respond to input signals from the keypad (via the **COM-MANDS** menu) and communications protocols. All virtual input operands are defaulted to "Off" (logic 0) unless the appropriate input signal is received.

If the **VIRTUAL INPUT x FUNCTION** is to "Disabled", the input will be forced to off (logic 0) regardless of any attempt to alter the input. If set to "Enabled", the input operates as shown on the logic diagram and generates output FlexLogic™ operands in response to received input signals and the applied settings.

There are two types of operation: self-reset and latched. If **VIRTUAL INPUT x TYPE** is "Self-Reset", when the input signal transits from off to on, the output operand will be set to on for only one evaluation of the FlexLogic™ equations and then return to off. If set to "Latched", the virtual input sets the state of the output operand to the same state as the most recent received input.

> **NOTE**
> **The self-reset operating mode generates the output operand for a single evaluation of the FlexLogic™ equations. If the operand is to be used anywhere other than internally in a FlexLogic™ equation, it will likely have to be lengthened in time. A FlexLogic™ timer with a delayed reset can perform this function.**
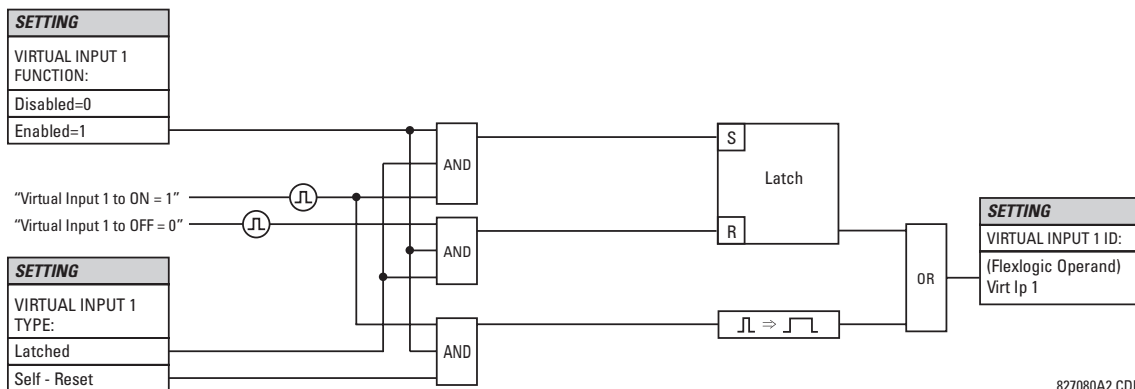

Figure 5–90: VIRTUAL INPUTS SCHEME LOGIC

a) DIGITAL OUTPUTS

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ CONTACT OUTPUTS ⇨ CONTACT OUTPUT H1

■ CONTACT OUTPUT H1 ■	CONTACT OUTPUT H1 ID Cont Op 1	*Range:* *Up to 12 alphanumeric characters*
MESSAGE	OUTPUT H1 OPERATE: Off	*Range:* *FlexLogic™ operand*
MESSAGE	OUTPUT H1 SEAL-IN: Off	*Range:* *FlexLogic™ operand*
MESSAGE	CONTACT OUTPUT H1 EVENTS: Enabled	*Range:* *Disabled, Enabled*

Upon startup of the relay, the main processor will determine from an assessment of the modules installed in the chassis which contact outputs are available and present the settings for only these outputs.

An ID may be assigned to each contact output. The signal that can **OPERATE** a contact output may be any FlexLogic™ operand (virtual output, element state, contact input, or virtual input). An additional FlexLogic™ operand may be used to **SEAL-IN** the relay. Any change of state of a contact output can be logged as an Event if programmed to do so.

For example, the trip circuit current is monitored by providing a current threshold detector in series with some Form-A contacts (see the trip circuit example in the *Digital elements* section). The monitor will set a flag (see the specifications for Form-A). The name of the FlexLogic™ operand set by the monitor, consists of the output relay designation, followed by the name of the flag; for example, CONT OP 1 ION or CONT OP 1 IOFF.

In most breaker control circuits, the trip coil is connected in series with a breaker auxiliary contact used to interrupt current flow after the breaker has tripped, to prevent damage to the less robust initiating contact. This can be done by monitoring an auxiliary contact on the breaker which opens when the breaker has tripped, but this scheme is subject to incorrect operation caused by differences in timing between breaker auxiliary contact change-of-state and interruption of current in the trip circuit. The most dependable protection of the initiating contact is provided by directly measuring current in the tripping circuit, and using this parameter to control resetting of the initiating relay. This scheme is often called *trip seal-in*.

This can be realized in the C60 using the CONT OP 1 ION FlexLogic™ operand to seal-in the contact output as follows:

> **CONTACT OUTPUT H1 ID:** "Cont Op 1"
> **OUTPUT H1 OPERATE:** *any suitable FlexLogic™ operand*
> **OUTPUT H1 SEAL-IN:** "Cont Op 1 IOn"
> **CONTACT OUTPUT H1 EVENTS:** "Enabled"

b) LATCHING OUTPUTS

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ CONTACT OUTPUTS ⇨ CONTACT OUTPUT H1a

■ CONTACT OUTPUT H1a ■	OUTPUT H1a ID L-Cont Op 1	*Range:* *Up to 12 alphanumeric characters*
MESSAGE	OUTPUT H1a OPERATE: Off	*Range:* *FlexLogic™ operand*
MESSAGE	OUTPUT H1a RESET: Off	*Range:* *FlexLogic™ operand*
MESSAGE	OUTPUT H1a TYPE: Operate-dominant	*Range:* *Operate-dominant, Reset-dominant*
MESSAGE	OUTPUT H1a EVENTS: Disabled	*Range:* *Disabled, Enabled*

The C60 latching output contacts are mechanically bi-stable and controlled by two separate (open and close) coils. As such they retain their position even if the relay is not powered up. The relay recognizes all latching output contact cards and populates the setting menu accordingly. On power up, the relay reads positions of the latching contacts from the hardware before executing any other functions of the relay (such as protection and control features or FlexLogic™).

The latching output modules, either as a part of the relay or as individual modules, are shipped from the factory with all latching contacts opened. It is highly recommended to double-check the programming and positions of the latching contacts when replacing a module.

Since the relay asserts the output contact and reads back its position, it is possible to incorporate self-monitoring capabilities for the latching outputs. If any latching outputs exhibits a discrepancy, the **LATCHING OUTPUT ERROR** self-test error is declared. The error is signaled by the LATCHING OUT ERROR FlexLogic™ operand, event, and target message.

- **OUTPUT H1a OPERATE**: This setting specifies a FlexLogic™ operand to operate the 'close coil' of the contact. The relay will seal-in this input to safely close the contact. Once the contact is closed and the **RESET** input is logic 0 (off), any activity of the **OPERATE** input, such as subsequent chattering, will not have any effect. With both the **OPERATE** and **RESET** inputs active (logic 1), the response of the latching contact is specified by the **OUTPUT H1A TYPE** setting.

- **OUTPUT H1a RESET**: This setting specifies a FlexLogic™ operand to operate the 'trip coil' of the contact. The relay will seal-in this input to safely open the contact. Once the contact is opened and the **OPERATE** input is logic 0 (off), any activity of the **RESET** input, such as subsequent chattering, will not have any effect. With both the **OPERATE** and **RESET** inputs active (logic 1), the response of the latching contact is specified by the **OUTPUT H1A TYPE** setting.

- **OUTPUT H1a TYPE**: This setting specifies the contact response under conflicting control inputs; that is, when both the **OPERATE** and **RESET** signals are applied. With both control inputs applied simultaneously, the contact will close if set to "Operate-dominant" and will open if set to "Reset-dominant".

Application Example 1:

A latching output contact H1a is to be controlled from two user-programmable pushbuttons (buttons number 1 and 2). The following settings should be applied.

Program the Latching Outputs by making the following changes in the **SETTINGS** ⇨⇩ **INPUTS/OUTPUTS** ⇨⇩ **CONTACT OUT-PUTS** ⇨ **CONTACT OUTPUT H1a** menu (assuming an H4L module):

OUTPUT H1a OPERATE: "PUSHBUTTON 1 ON"
OUTPUT H1a RESET: "PUSHBUTTON 2 ON"

Program the pushbuttons by making the following changes in the **PRODUCT SETUP** ⇨⇩ **USER-PROGRAMMABLE PUSHBUT-TONS** ⇨⇩ **USER PUSHBUTTON 1** and **USER PUSHBUTTON 2** menus:

PUSHBUTTON 1 FUNCTION: "Self-reset"	**PUSHBUTTON 2 FUNCTION:** "Self-reset"
PUSHBTN 1 DROP-OUT TIME: "0.00 s"	**PUSHBTN 2 DROP-OUT TIME:** "0.00 s"

Application Example 2:

A relay, having two latching contacts H1a and H1c, is to be programmed. The H1a contact is to be a Type-a contact, while the H1c contact is to be a Type-b contact (Type-a means closed after exercising the operate input; Type-b means closed after exercising the reset input). The relay is to be controlled from virtual outputs: VO1 to operate and VO2 to reset.

Program the Latching Outputs by making the following changes in the **SETTINGS** ⇨⇩ **INPUTS/OUTPUTS** ⇨⇩ **CONTACT OUT-PUTS** ⇨ **CONTACT OUTPUT H1a** and **CONTACT OUTPUT H1c** menus (assuming an H4L module):

OUTPUT H1a OPERATE: "VO1"	**OUTPUT H1c OPERATE:** "VO2"
OUTPUT H1a RESET: "VO2"	**OUTPUT H1c RESET:** "VO1"

Since the two physical contacts in this example are mechanically separated and have individual control inputs, they will not operate at exactly the same time. A discrepancy in the range of a fraction of a maximum operating time may occur. Therefore, a pair of contacts programmed to be a multi-contact relay will not guarantee any specific sequence of operation (such as make before break). If required, the sequence of operation must be programmed explicitly by delaying some of the control inputs as shown in the next application example.

Application Example 3:

A make before break functionality must be added to the preceding example. An overlap of 20 ms is required to implement this functionality as described below:

Write the following FlexLogic™ equation (EnerVista UR Setup example shown):

FLEXLOGIC ENTRY	TYPE	SYNTAX
View Graphic	View	View
FlexLogic Entry 1	Virtual Outputs On	Virt Op 1 On (VO1)
FlexLogic Entry 2	TIMER	Timer 1
FlexLogic Entry 3	Assign Virtual Output	= Virt Op 3 (VO3)
FlexLogic Entry 4	Virtual Outputs On	Virt Op 2 On (VO2)
FlexLogic Entry 5	TIMER	Timer 2
FlexLogic Entry 6	Assign Virtual Output	= Virt Op 4 (VO4)
FlexLogic Entry 7	End of List	

Both timers (Timer 1 and Timer 2) should be set to 20 ms pickup and 0 ms dropout.

Program the Latching Outputs by making the following changes in the **SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ CONTACT OUT-PUTS ⇨ CONTACT OUTPUT H1a** and **CONTACT OUTPUT H1c** menus (assuming an H4L module):

    OUTPUT H1a OPERATE: "VO1"   **OUTPUT H1c OPERATE:** "VO2"
    OUTPUT H1a RESET: "VO4"   **OUTPUT H1c RESET:** "VO3"

Application Example 4:

A latching contact H1a is to be controlled from a single virtual output VO1. The contact should stay closed as long as VO1 is high, and should stay opened when VO1 is low. Program the relay as follows.

Write the following FlexLogic™ equation (EnerVista UR Setup example shown):

FLEXLOGIC ENTRY	TYPE	SYNTAX
View Graphic	View	View
FlexLogic Entry 1	Virtual Outputs On	Virt Op 1 On (VO1)
FlexLogic Entry 2	NOT	1 Input
FlexLogic Entry 3	Assign Virtual Output	= Virt Op 2 (VO2)
FlexLogic Entry 4	End of List	

Program the Latching Outputs by making the following changes in the **SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ CONTACT OUT-PUTS ⇨ CONTACT OUTPUT H1a** menu (assuming an H4L module):

    OUTPUT H1a OPERATE: "VO1"
    OUTPUT H1a RESET: "VO2"

5.7.4 VIRTUAL OUTPUTS

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ VIRTUAL OUTPUTS ⇨ VIRTUAL OUTPUT 1(96)

```
■ VIRTUAL OUTPUT  1
■
```
◄❚❚►
```
VIRTUAL OUTPUT  1 ID
Virt Op 1
```
Range: Up to 12 alphanumeric characters

          MESSAGE ⬆
```
VIRTUAL OUTPUT  1
EVENTS: Disabled
```
Range: Disabled, Enabled

There are 96 virtual outputs that may be assigned via FlexLogic™. If not assigned, the output will be forced to 'OFF' (Logic 0). An ID may be assigned to each virtual output. Virtual outputs are resolved in each pass through the evaluation of the FlexLogic™ equations. Any change of state of a virtual output can be logged as an event if programmed to do so.

For example, if Virtual Output 1 is the trip signal from FlexLogic™ and the trip relay is used to signal events, the settings would be programmed as follows:

VIRTUAL OUTPUT 1 ID: "Trip"
VIRTUAL OUTPUT 1 EVENTS: "Disabled"

5.7.5 REMOTE DEVICES

a) REMOTE INPUTS/OUTPUTS OVERVIEW

Remote inputs and outputs provide a means of exchanging digital state information between Ethernet-networked devices. The IEC 61850 GSSE (Generic Substation State Event) and GOOSE (Generic Object Oriented Substation Event) standards are used.

> **NOTE** **The IEC 61850 specification requires that communications between devices be implemented on Ethernet. For UR-series relays, Ethernet communications is provided on all CPU modules except type 9E.**

The sharing of digital point state information between GSSE/GOOSE equipped relays is essentially an extension to FlexLogic™, allowing distributed FlexLogic™ by making operands available to/from devices on a common communications network. In addition to digital point states, GSSE/GOOSE messages identify the originator of the message and provide other information required by the communication specification. All devices listen to network messages and capture data only from messages that have originated in selected devices.

IEC 61850 GSSE messages are compatible with UCA GOOSE messages and contain a fixed set of digital points. IEC 61850 GOOSE messages can, in general, contain any configurable data items. When used by the remote input/output feature, IEC 61850 GOOSE messages contain the same data as GSSE messages.

Both GSSE and GOOSE messages are designed to be short, reliable, and high priority. GOOSE messages have additional advantages over GSSE messages due to their support of VLAN (virtual LAN) and Ethernet priority tagging functionality. The GSSE message structure contains space for 128 bit pairs representing digital point state information. The IEC 61850 specification provides 32 "DNA" bit pairs that represent the state of two pre-defined events and 30 user-defined events. All remaining bit pairs are "UserSt" bit pairs, which are status bits representing user-definable events. The C60 implementation provides 32 of the 96 available UserSt bit pairs.

The IEC 61850 specification includes features that are used to cope with the loss of communication between transmitting and receiving devices. Each transmitting device will send a GSSE/GOOSE message upon a successful power-up, when the state of any included point changes, or after a specified interval (the *default update* time) if a change-of-state has not occurred. The transmitting device also sends a 'hold time' which is set greater than three times the programmed default time required by the receiving device.

Receiving devices are constantly monitoring the communications network for messages they require, as recognized by the identification of the originating device carried in the message. Messages received from remote devices include the message *time allowed to live*. The receiving relay sets a timer assigned to the originating device to this time interval, and if it has not received another message from this device at time-out, the remote device is declared to be non-communicating, so it will use the programmed default state for all points from that specific remote device. If a message is received from a remote device before the *time allowed to live* expires, all points for that device are updated to the states contained in the message and the hold timer is restarted. The status of a remote device, where "Offline" indicates non-communicating, can be displayed.

The remote input/output facility provides for 32 remote inputs and 64 remote outputs.

b) LOCAL DEVICES: ID OF DEVICE FOR TRANSMITTING GSSE MESSAGES

In a C60 relay, the device ID that represents the IEC 61850 GOOSE application ID (GoID) name string sent as part of each GOOSE message is programmed in the **SETTINGS** ⇨ **PRODUCT SETUP** ⇨⇩ **COMMUNICATIONS** ⇨⇩ **IEC 61850 PROTOCOL** ⇨ **GSSE/GOOSE CONFIGURATION** ⇨ **TRANSMISSION** ⇨⇩ **FIXED GOOSE** ⇨⇩ **GOOSE ID** setting.

Likewise, the device ID that represents the IEC 61850 GSSE application ID name string sent as part of each GSSE message is programmed in the **SETTINGS** ⇨ **PRODUCT SETUP** ⇨⇩ **COMMUNICATIONS** ⇨⇩ **IEC 61850 PROTOCOL** ⇨ **GSSE/GOOSE CONFIGURATION** ⇨ **TRANSMISSION** ⇨⇩ **GSSE** ⇨⇩ **GSSE ID** setting.

In C60 releases previous to 5.0x, these name strings were represented by the **RELAY NAME** setting.

c) REMOTE DEVICES: ID OF DEVICE FOR RECEIVING GSSE MESSAGES

PATH: SETTINGS ⇨⇩ **INPUTS/OUTPUTS** ⇨⇩ **REMOTE DEVICES** ⇨ **REMOTE DEVICE 1(16)**

```
■ REMOTE DEVICE  1        ◄│►    REMOTE DEVICE  1 ID:       Range:  up to 20 alphanumeric characters
■                                Remote Device 1

                MESSAGE    ▲▼     REMOTE DEVICE  1           Range:  0 to 16383 in steps of 1
                                 ETYPE APPID: 0

                MESSAGE    ▲      REMOTE DEVICE  1           Range:  Fixed, GOOSE 1 through GOOSE 8
                                 DATASET: Fixed
```

Remote devices are available for setting purposes. A receiving relay must be programmed to capture messages from only those originating remote devices of interest. This setting is used to select specific remote devices by entering (bottom row) the exact identification (ID) assigned to those devices.

The **REMOTE DEVICE 1 ETYPE APPID** setting is only used with GOOSE messages; they are not applicable to GSSE messages. This setting identifies the Ethernet application identification in the GOOSE message. It should match the corresponding settings on the sending device.

The **REMOTE DEVICE 1 DATASET** setting provides for the choice of the C60 fixed (DNA/UserSt) dataset (that is, containing DNA and UserSt bit pairs), or one of the configurable datasets.

Note that the dataset for the received data items must be made up of existing items in an existing logical node. For this reason, logical node GGIO3 is instantiated to hold the incoming data items. GGIO3 is not necessary to make use of the received data. The remote input data item mapping takes care of the mapping of the inputs to remote input FlexLogic™ operands. However, GGIO3 data can be read by IEC 61850 clients.

5.7.6 REMOTE INPUTS

5

PATH: SETTINGS ⇨⇩ **INPUTS/OUTPUTS** ⇨⇩ **REMOTE INPUTS** ⇨ **REMOTE INPUT 1(32)**

```
■ REMOTE INPUT 1          ◄│►    REMOTE INPUT  1 ID:        Range:  up to 12 alphanumeric characters

                MESSAGE    ▲▼     REMOTE IN  1 DEFAULT       Range:  On, Off, Latest/On, Latest/Off
                                 STATE: Off

                MESSAGE    ▲      REMOTE IN  1               Range:  Disabled, Enabled
                                 EVENTS: Disabled
```

Remote Inputs that create FlexLogic™ operands at the receiving relay are extracted from GSSE/GOOSE messages originating in remote devices. Each remote input can be selected from a list consisting of 64 selections: DNA-1 through DNA-32 and UserSt-1 through UserSt-32. The function of DNA inputs is defined in the IEC 61850 specification and is presented in the IEC 61850 DNA Assignments table in the *Remote outputs* section. The function of UserSt inputs is defined by the user selection of the FlexLogic™ operand whose state is represented in the GSSE/GOOSE message. A user must program a DNA point from the appropriate FlexLogic™ operand.

Remote input 1 must be programmed to replicate the logic state of a specific signal from a specific remote device for local use. This programming is performed via the three settings shown above.

The **REMOTE INPUT 1 ID** setting allows the user to assign descriptive text to the remote input. The **REMOTE IN 1 DEVICE** setting selects the number (1 to 16) of the remote device which originates the required signal, as previously assigned to the remote device via the setting **REMOTE DEVICE 1(16) ID** (see the *Remote devices* section). The **REMOTE IN 1 ITEM** setting selects the specific bits of the GSSE/GOOSE message required.

The **REMOTE IN 1 DEFAULT STATE** setting selects the logic state for this point if the local relay has just completed startup or the remote device sending the point is declared to be non-communicating. The following choices are available:

- Setting **REMOTE IN 1 DEFAULT STATE** to "On" value defaults the input to logic 1.

- Setting **REMOTE IN 1 DEFAULT STATE** to "Off" value defaults the input to logic 0.

- Setting **REMOTE IN 1 DEFAULT STATE** to "Latest/On" freezes the input in case of lost communications. If the latest state is not known, such as after relay power-up but before the first communication exchange, the input will default to logic 1. When communication resumes, the input becomes fully operational.

- Setting **REMOTE IN 1 DEFAULT STATE** to "Latest/Off" freezes the input in case of lost communications. If the latest state is not known, such as after relay power-up but before the first communication exchange, the input will default to logic 0. When communication resumes, the input becomes fully operational.

> **NOTE**
> **For additional information on GSSE/GOOOSE messaging, refer to the *Remote devices* section in this chapter.**

5.7.7 REMOTE OUTPUTS

a) DNA BIT PAIRS

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ REMOTE OUTPUTS DNA BIT PAIRS ⇨ REMOTE OUPUTS DNA- 1(32) BIT PAIR

```
■ REMOTE OUTPUTS
■ DNA- 1 BIT PAIR
```
◀▶

```
DNA- 1 OPERAND:
Off
```
Range: FlexLogic™ operand

MESSAGE ▲

```
DNA- 1 EVENTS:
Disabled
```
Range: Disabled, Enabled

Remote outputs (1 to 32) are FlexLogic™ operands inserted into GSSE/GOOSE messages that are transmitted to remote devices on a LAN. Each digital point in the message must be programmed to carry the state of a specific FlexLogic™ operand. The above operand setting represents a specific DNA function (as shown in the following table) to be transmitted.

Table 5–21: IEC 61850 DNA ASSIGNMENTS

DNA	IEC 61850 DEFINITION	FLEXLOGIC™ OPERAND
1	Test	IEC 61850 TEST MODE
2	ConfRev	IEC 61850 CONF REV

b) USERST BIT PAIRS

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ REMOTE OUTPUTS UserSt BIT PAIRS ⇨ REMOTE OUTPUTS UserSt- 1(32) BIT PAIR

```
■ REMOTE OUTPUTS
■ UserSt- 1 BIT PAIR
```
◀▶

```
UserSt- 1 OPERAND:
Off
```
Range: FlexLogic™ operand

MESSAGE ▲

```
UserSt- 1 EVENTS:
Disabled
```
Range: Disabled, Enabled

Remote outputs 1 to 32 originate as GSSE/GOOSE messages to be transmitted to remote devices. Each digital point in the message must be programmed to carry the state of a specific FlexLogic™ operand. The setting above is used to select the operand which represents a specific UserSt function (as selected by the user) to be transmitted.

The following setting represents the time between sending GSSE/GOOSE messages when there has been no change of state of any selected digital point. This setting is located in the **PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ IEC 61850 PROTOCOL ⇨⇩ GSSE/GOOSE CONFIGURATION** settings menu.

```
DEFAULT GSSE/GOOSE
UPDATE TIME: 60 s
```
Range: 1 to 60 s in steps of 1

> **NOTE**
> **For more information on GSSE/GOOSE messaging, refer to *Remote Inputs/Outputs Overview* in the *Remote Devices* section.**

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ RESETTING

```
■ RESETTING                     ◀▮▶    RESET OPERAND:          Range:  FlexLogic™ operand
■                                      Off
```

Some events can be programmed to latch the faceplate LED event indicators and the target message on the display. Once set, the latching mechanism will hold all of the latched indicators or messages in the set state after the initiating condition has cleared until a RESET command is received to return these latches (not including FlexLogic™ latches) to the reset state. The RESET command can be sent from the faceplate Reset button, a remote device via a communications channel, or any programmed operand.

When the RESET command is received by the relay, two FlexLogic™ operands are created. These operands, which are stored as events, reset the latches if the initiating condition has cleared. The three sources of RESET commands each create the RESET OP FlexLogic™ operand. Each individual source of a RESET command also creates its individual operand RESET OP (PUSHBUTTON), RESET OP (COMMS) or RESET OP (OPERAND) to identify the source of the command. The setting shown above selects the operand that will create the RESET OP (OPERAND) operand.

5.7.9 DIRECT INPUTS/OUTPUTS

a) DIRECT INPUTS

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ DIRECT INPUTS ⇨ DIRECT INPUT 1(32)

```
■ DIRECT INPUT  1      ◀▮▶    DIRECT INPUT  1          Range:  up to 12 alphanumeric characters
■                             NAME: Dir Ip 1

              MESSAGE  ⬆⬇     DIRECT INPUT  1          Range:  1 to 16
                              DEVICE ID: 1

              MESSAGE  ⬆⬇     DIRECT INPUT  1          Range:  1 to 32
                              BIT NUMBER:  1

              MESSAGE  ⬆⬇     DIRECT INPUT  1          Range:  On, Off, Latest/On, Latest/Off
                              DEFAULT STATE: Off

              MESSAGE  ⬆      DIRECT INPUT  1          Range:  Enabled, Disabled
                              EVENTS: Disabled
```

These settings specify how the direct input information is processed. The **DIRECT INPUT 1 NAME** setting allows the user to assign a descriptive name to the direct input. The **DIRECT INPUT 1 DEVICE ID** represents the source of direct input 1. The specified direct input is driven by the device identified here.

The **DIRECT INPUT 1 BIT NUMBER** is the bit number to extract the state for direct input 1. Direct Input 1 is driven by the bit identified as **DIRECT INPUT 1 BIT NUMBER**. This corresponds to the direct output number of the sending device.

The **DIRECT INPUT 1 DEFAULT STATE** represents the state of the direct input when the associated direct device is offline. The following choices are available:

- Setting **DIRECT INPUT 1 DEFAULT STATE** to "On" value defaults the input to Logic 1.

- Setting **DIRECT INPUT 1 DEFAULT STATE** to "Off" value defaults the input to Logic 0.

- Setting **DIRECT INPUT 1 DEFAULT STATE** to "Latest/On" freezes the input in case of lost communications. If the latest state is not known, such as after relay power-up but before the first communication exchange, the input will default to Logic 1. When communication resumes, the input becomes fully operational.

- Setting **DIRECT INPUT 1 DEFAULT STATE** to "Latest/Off" freezes the input in case of lost communications. If the latest state is not known, such as after relay power-up but before the first communication exchange, the input will default to Logic 0. When communication resumes, the input becomes fully operational.

b) DIRECT OUTPUTS

PATH: SETTINGS ⇨⇩ **INPUTS/OUTPUTS** ⇨⇩ **DIRECT OUTPUTS** ⇨ **DIRECT OUTPUT 1(32)**

```
■ DIRECT OUTPUT  1
■
```
◁▷

```
DIRECT OUT  1 NAME:
Dir Out 1
```
Range: up to 12 alphanumeric characters

MESSAGE ⬆⬇

```
DIRECT OUT  1 OPERAND:
Off
```
Range: FlexLogic™ operand

MESSAGE ⬆

```
DIRECT OUTPUT  1
EVENTS: Disabled
```
Range: Enabled, Disabled

The **DIRECT OUT 1 NAME** setting allows the user to assign a descriptive name to the direct output. The **DIR OUT 1 OPERAND** is the FlexLogic™ operand that determines the state of this direct output.

c) APPLICATION EXAMPLES

The examples introduced in the earlier *Direct inputs and outputs* section (part of the *Product Setup* section) are continued below to illustrate usage of the direct inputs and outputs.

Example 1: Extending input/output capabilities of a C60 relay

Consider an application that requires additional quantities of digital inputs or output contacts or lines of programmable logic that exceed the capabilities of a single UR-series chassis. The problem is solved by adding an extra UR-series IED, such as the C30, to satisfy the additional inputs/outputs and programmable logic requirements. The two IEDs are connected via single-channel digital communication cards as shown below.
Figure 5–91: INPUT AND OUTPUT EXTENSION VIA DIRECT INPUTS AND OUTPUTS

Assume contact input 1 from UR IED 2 is to be used by UR IED 1. The following settings should be applied (Direct Input 5 and bit number 12 are used, as an example):

UR IED 1: **DIRECT INPUT 5 DEVICE ID** = "2"   UR IED 2: **DIRECT OUT 12 OPERAND** = "Cont Ip 1 On"
    DIRECT INPUT 5 BIT NUMBER = "12"

The Cont Ip 1 On operand of UR IED 2 is now available in UR IED 1 as DIRECT INPUT 5 ON.

Example 2: Interlocking busbar protection

A simple interlocking busbar protection scheme can be accomplished by sending a blocking signal from downstream devices, say 2, 3 and 4, to the upstream device that monitors a single incomer of the busbar, as shown in the figure below.
Figure 5–92: SAMPLE INTERLOCKING BUSBAR PROTECTION SCHEME

Assume that Phase Instantaneous Overcurrent 1 is used by Devices 2, 3, and 4 to block Device 1. If not blocked, Device 1 would trip the bus upon detecting a fault and applying a short coordination time delay.

The following settings should be applied (assume Bit 3 is used by all 3 devices to sent the blocking signal and Direct Inputs 7, 8, and 9 are used by the receiving device to monitor the three blocking signals):

UR IED 2:   **DIRECT OUT 3 OPERAND**: "PHASE IOC1 OP"

UR IED 3:   **DIRECT OUT 3 OPERAND**: "PHASE IOC1 OP"

UR IED 4:   **DIRECT OUT 3 OPERAND**: "PHASE IOC1 OP"

UR IED 1:   **DIRECT INPUT 7 DEVICE ID**: "2"
              DIRECT INPUT 7 BIT NUMBER: "3"
              DIRECT INPUT 7 DEFAULT STATE: select "On" for security, select "Off" for dependability

              DIRECT INPUT 8 DEVICE ID: "3"
              DIRECT INPUT 8 BIT NUMBER: "3"
              DIRECT INPUT 8 DEFAULT STATE: select "On" for security, select "Off" for dependability

              DIRECT INPUT 9 DEVICE ID: "4"
              DIRECT INPUT 9 BIT NUMBER: "3"
              DIRECT INPUT 9 DEFAULT STATE: select "On" for security, select "Off" for dependability

Now the three blocking signals are available in UR IED 1 as DIRECT INPUT 7 ON, DIRECT INPUT 8 ON, and DIRECT INPUT 9 ON. Upon losing communications or a device, the scheme is inclined to block (if any default state is set to "On"), or to trip the bus on any overcurrent condition (all default states set to "Off").

Example 2: Pilot-aided schemes

Consider a three-terminal line protection application shown in the figure below.
Figure 5–93: THREE-TERMINAL LINE APPLICATION

Assume the Hybrid Permissive Overreaching Transfer Trip (Hybrid POTT) scheme is applied using the architecture shown below. The scheme output operand HYB POTT TX1 is used to key the permission.
Figure 5–94: SINGLE-CHANNEL OPEN-LOOP CONFIGURATION

In the above architecture, Devices 1 and 3 do not communicate directly. Therefore, Device 2 must act as a 'bridge'. The following settings should be applied:

UR IED 1:   **DIRECT OUT 2 OPERAND:** "HYB POTT TX1"
             DIRECT INPUT 5 DEVICE ID: "2"
             DIRECT INPUT 5 BIT NUMBER: "2" (this is a message from IED 2)
             DIRECT INPUT 6 DEVICE ID: "2"
             DIRECT INPUT 6 BIT NUMBER: "4" (effectively, this is a message from IED 3)

UR IED 3:   **DIRECT OUT 2 OPERAND:** "HYB POTT TX1"
             DIRECT INPUT 5 DEVICE ID: "2"
             DIRECT INPUT 5 BIT NUMBER: "2" (this is a message from IED 2)
             DIRECT INPUT 6 DEVICE ID: "2"
             DIRECT INPUT 6 BIT NUMBER: "3" (effectively, this is a message from IED 1)

UR IED 2:   **DIRECT INPUT 5 DEVICE ID:** "1"
             DIRECT INPUT 5 BIT NUMBER: "2"
             DIRECT INPUT 6 DEVICE ID: "3"
             DIRECT INPUT 6 BIT NUMBER: "2"
             DIRECT OUT 2 OPERAND: "HYB POTT TX1"
             DIRECT OUT 3 OPERAND: "DIRECT INPUT 5" (forward a message from 1 to 3)
             DIRECT OUT 4 OPERAND: "DIRECT INPUT 6" (forward a message from 3 to 1)

Signal flow between the three IEDs is shown in the figure below:
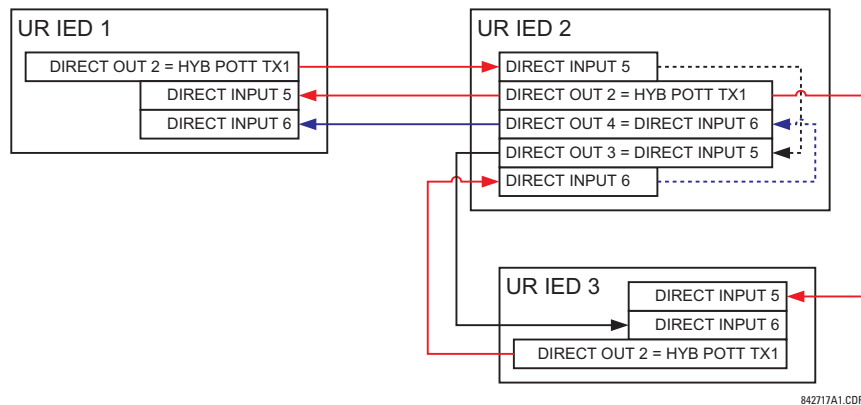

Figure 5–95: SIGNAL FLOW FOR DIRECT INPUT AND OUTPUT – EXAMPLE 3

In three-terminal applications, both the remote terminals must grant permission to trip. Therefore, at each terminal, direct inputs 5 and 6 should be ANDed in FlexLogic™ and the resulting operand configured as the permission to trip (**HYB POTT RX1** setting).

a) OVERVIEW

The relay provides sixteen teleprotection inputs on communications channel 1 (numbered 1-1 through 1-16) and sixteen teleprotection inputs on communications channel 2 (on two-terminals two-channel and three-terminal systems only, numbered 2-1 through 2-16). The remote relay connected to channels 1 and 2 of the local relay is programmed by assigning FlexLogic™ operands to be sent via the selected communications channel. This allows the user to create distributed protection and control schemes via dedicated communications channels. Some examples are directional comparison pilot schemes and direct transfer tripping. It should be noted that failures of communications channels will affect teleprotection functionality. The teleprotection function must be enabled to utilize the inputs.

b) TELEPROTECTION INPUTS

PATH: SETTINGS ⇨ ⇩ INPUTS/OUTPUTS ⇨ ⇩ TELEPROTECTION ⇨ TELEPROT INPUTS

```
■ TELEPROT INPUTS          ◀▮▶    TELEPROT INPUT 1-1        Range:  Off, On, Latest/Off, Latest/On
■                                 DEFAULT: Off

                  MESSAGE  ▲▼      TELEPROT INPUT 1-2        Range:  Off, On, Latest/Off, Latest/On
                                  DEFAULT: Off

                                         ↓

                  MESSAGE  ▲▼      TELEPROT INPUT 1-16       Range:  Off, On, Latest/Off, Latest/On
                                  DEFAULT: Off

                  MESSAGE  ▲▼      TELEPROT INPUT 2-1        Range:  Off, On, Latest/Off, Latest/On
                                  DEFAULT: Off

                  MESSAGE  ▲▼      TELEPROT INPUT 2-2        Range:  Off, On, Latest/Off, Latest/On
                                  DEFAULT: Off

                                         ↓

                  MESSAGE  ▲       TELEPROT INPUT 2-16       Range:  Off, On, Latest/Off, Latest/On
                                  DEFAULT: Off
```

Setting the **TELEPROT INPUT ~~ DEFAULT** setting to "On" defaults the input to logic 1 when the channel fails. A value of "Off" defaults the input to logic 0 when the channel fails.

The "Latest/On" and "Latest/Off" values freeze the input in case of lost communications. If the latest state is not known, such as after relay power-up but before the first communication exchange, then the input defaults to logic 1 for "Latest/On" and logic 0 for "Latest/Off".

c) TELEPROTECTION OUTPUTS

PATH: SETTINGS ⇨⇩ INPUTS/OUTPUTS ⇨⇩ TELEPROTECTION ⇨⇩ TELEPROT OUTPUTS
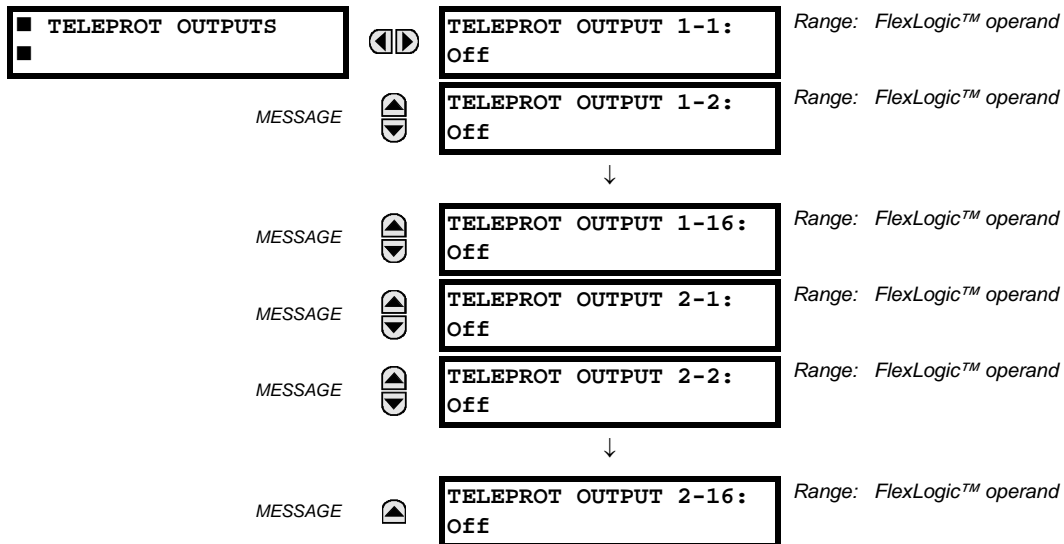

As the following figure demonstrates, processing of the teleprotection inputs/outputs is dependent on the number of communication channels and terminals. On two-terminal two-channel systems, they are processed continuously on each channel and mapped separately per channel. Therefore, to achieve redundancy, the user must assign the same operand on both channels (teleprotection outputs at the sending end or corresponding teleprotection inputs at the receiving end). On three-terminal two-channel systems, redundancy is achieved by programming signal re-transmittal in the case of channel failure between any pair of relays.

```

Hardware and software is provided to receive signals from external transducers and convert these signals into a digital format for use as required. The relay will accept inputs in the range of –1 to +20 mA DC, suitable for use with most common transducer output ranges; all inputs are assumed to be linear over the complete range. Specific hardware details are contained in chapter 3.

Before the dcmA input signal can be used, the value of the signal measured by the relay must be converted to the range and quantity of the external transducer primary input parameter, such as DC voltage or temperature. The relay simplifies this process by internally scaling the output from the external transducer and displaying the actual primary parameter.

dcmA input channels are arranged in a manner similar to CT and VT channels. The user configures individual channels with the settings shown here.

The channels are arranged in sub-modules of two channels, numbered from 1 through 8 from top to bottom. On power-up, the relay will automatically generate configuration settings for every channel, based on the order code, in the same general manner that is used for CTs and VTs. Each channel is assigned a slot letter followed by the row number, 1 through 8 inclusive, which is used as the channel number. The relay generates an actual value for each available input channel.

Settings are automatically generated for every channel available in the specific relay as shown above for the first channel of a type 5F transducer module installed in slot H.

The function of the channel may be either "Enabled" or "Disabled". If "Disabled", no actual values are created for the channel. An alphanumeric "ID" is assigned to each channel; this ID will be included in the channel actual value, along with the programmed units associated with the parameter measured by the transducer, such as volts, °C, megawatts, etc. This ID is also used to reference the channel as the input parameter to features designed to measure this type of parameter. The **DCMA INPUT H1 RANGE** setting specifies the mA DC range of the transducer connected to the input channel.

The **DCMA INPUT H1 MIN VALUE** and **DCMA INPUT H1 MAX VALUE** settings are used to program the span of the transducer in primary units. For example, a temperature transducer might have a span from 0 to 250°C; in this case the **DCMA INPUT H1 MIN VALUE** value is "0" and the **DCMA INPUT H1 MAX VALUE** value is "250". Another example would be a watts transducer with a span from –20 to +180 MW; in this case the **DCMA INPUT H1 MIN VALUE** value would be "–20" and the **DCMA INPUT H1 MAX VALUE** value "180". Intermediate values between the min and max values are scaled linearly.

```
RTD INPUT H1 TYPE:
100Ω Nickel
```
Range: 100Ω Nickel, 10Ω Copper, 100Ω Platinum, 120Ω Nickel

Hardware and software is provided to receive signals from external resistance temperature detectors and convert these signals into a digital format for use as required. These channels are intended to be connected to any of the RTD types in common use. Specific hardware details are contained in chapter 3.

RTD input channels are arranged in a manner similar to CT and VT channels. The user configures individual channels with the settings shown here.

The channels are arranged in sub-modules of two channels, numbered from 1 through 8 from top to bottom. On power-up, the relay will automatically generate configuration settings for every channel, based on the order code, in the same general manner that is used for CTs and VTs. Each channel is assigned a slot letter followed by the row number, 1 through 8 inclusive, which is used as the channel number. The relay generates an actual value for each available input channel.

Settings are automatically generated for every channel available in the specific relay as shown above for the first channel of a type 5C transducer module installed in the first available slot.

The function of the channel may be either "Enabled" or "Disabled". If "Disabled", there will not be an actual value created for the channel. An alphanumeric ID is assigned to the channel; this ID will be included in the channel actual values. It is also used to reference the channel as the input parameter to features designed to measure this type of parameter. Selecting the type of RTD connected to the channel configures the channel.

Actions based on RTD overtemperature, such as trips or alarms, are done in conjunction with the FlexElements™ feature. In FlexElements™, the operate level is scaled to a base of 100°C. For example, a trip level of 150°C is achieved by setting the operate level at 1.5 pu. FlexElement™ operands are available to FlexLogic™ for further interlocking or to operate an output contact directly.

Refer to the following table for reference temperature values for each RTD type.

Table 5–22: RTD TEMPERATURE VS. RESISTANCE

          MESSAGE    ▲     DCMA OUTPUT H1
                           MAX VAL: 1.000 pu
```
Range: −90.000 to 90.000 pu in steps of 0.001

Hardware and software is provided to generate dcmA signals that allow interfacing with external equipment. Specific hardware details are contained in chapter 3. The dcmA output channels are arranged in a manner similar to transducer input or CT and VT channels. The user configures individual channels with the settings shown below.

The channels are arranged in sub-modules of two channels, numbered 1 through 8 from top to bottom. On power-up, the relay automatically generates configuration settings for every channel, based on the order code, in the same manner used for CTs and VTs. Each channel is assigned a slot letter followed by the row number, 1 through 8 inclusive, which is used as the channel number.

Both the output range and a signal driving a given output are user-programmable via the following settings menu (an example for channel M5 is shown).

The relay checks the driving signal (x in equations below) for the minimum and maximum limits, and subsequently rescales so the limits defined as **MIN VAL** and **MAX VAL** match the output range of the hardware defined as **RANGE**. The following equation is applied:

$$I_{out} = \begin{cases} I_{min} & \text{if } x < \textbf{MIN VAL} \\ I_{max} & \text{if } x > \textbf{MAX VAL} \\ k(x - \textbf{MIN VAL}) + I_{min} & \text{otherwise} \end{cases}$$

(EQ 5.20)

where: x is a driving signal specified by the **SOURCE** setting
I_{min} and I_{max} are defined by the **RANGE** setting
k is a scaling constant calculated as:

$$k = \frac{I_{max} - I_{min}}{\textbf{MAX VAL} - \textbf{MIN VAL}}$$

(EQ 5.21)

The feature is intentionally inhibited if the **MAX VAL** and **MIN VAL** settings are entered incorrectly, e.g. when **MAX VAL** − **MIN VAL** < 0.1 pu. The resulting characteristic is illustrated in the following figure.
Figure 5–97: DCMA OUTPUT CHARACTERISTIC

The dcmA output settings are described below.

- **DCMA OUTPUT H1 SOURCE**: This setting specifies an internal analog value to drive the analog output. Actual values (FlexAnalog parameters) such as power, current amplitude, voltage amplitude, power factor, etc. can be configured as sources driving dcmA outputs. Refer to Appendix A for a complete list of FlexAnalog parameters.

- **DCMA OUTPUT H1 RANGE**: This setting allows selection of the output range. Each dcmA channel may be set independently to work with different ranges. The three most commonly used output ranges are available.

- **DCMA OUTPUT H1 MIN VAL**: This setting allows setting the minimum limit for the signal that drives the output. This setting is used to control the mapping between an internal analog value and the output current (see the following examples). The setting is entered in per-unit values. The base units are defined in the same manner as the FlexElement™ base units.

- **DCMA OUTPUT H1 MAX VAL**: This setting allows setting the maximum limit for the signal that drives the output. This setting is used to control the mapping between an internal analog value and the output current (see the following

examples). The setting is entered in per-unit values. The base units are defined in the same manner as the FlexElement™ base units.

> **NOTE**
>
> The **DCMA OUTPUT H1 MIN VAL** and **DCMA OUTPUT H1 MAX VAL** settings are ignored for power factor base units (i.e. if the **DCMA OUTPUT H1 SOURCE** is set to FlexAnalog value based on power factor measurement).

Three application examples are described below.

Example 1:

A three phase active power on a 13.8 kV system measured via UR-series relay source 1 is to be monitored by the dcmA H1 output of the range of –1 to 1 mA. The following settings are applied on the relay: CT ratio = 1200:5, VT secondary 115, VT connection is delta, and VT ratio = 120. The nominal current is 800 A primary and the nominal power factor is 0.90. The power is to be monitored in both importing and exporting directions and allow for 20% overload compared to the nominal.

The nominal three-phase power is:

$$P = \sqrt{3} \times 13.8 \text{ kV} \times 0.8 \text{ kA} \times 0.9 = 17.21 \text{ MW} \tag{EQ 5.22}$$

The three-phase power with 20% overload margin is:

$$P_{max} = 1.2 \times 17.21 \text{ MW} = 20.65 \text{ MW} \tag{EQ 5.23}$$

The base unit for power (refer to the FlexElements section in this chapter for additional details) is:

$$P_{BASE} = 115 \text{ V} \times 120 \times 1.2 \text{ kA} = 16.56 \text{ MW} \tag{EQ 5.24}$$

The minimum and maximum power values to be monitored (in pu) are:

$$\text{minimum power} = \frac{-20.65 \text{ MW}}{16.56 \text{ MW}} = -1.247 \text{ pu}, \quad \text{maximum power} = \frac{20.65 \text{ MW}}{16.56 \text{ MW}} = 1.247 \text{ pu} \tag{EQ 5.25}$$

The following settings should be entered:

    DCMA OUTPUT H1 SOURCE: "SRC 1 P"
    DCMA OUTPUT H1 RANGE: "–1 to 1 mA"
    DCMA OUTPUT H1 MIN VAL: "–1.247 pu"
    DCMA OUTPUT H1 MAX VAL: "1.247 pu"

With the above settings, the output will represent the power with the scale of 1 mA per 20.65 MW. The worst-case error for this application can be calculated by superimposing the following two sources of error:

- $\pm 0.5\%$ of the full scale for the analog output module, or $\pm 0.005 \times (1 - (-1)) \times 20.65 \text{ MW} = \pm 0.207 \text{ MW}$

- $\pm 1\%$ of reading error for the active power at power factor of 0.9

For example at the reading of 20 MW, the worst-case error is $0.01 \times 20 \text{ MW} + 0.207 \text{ MW} = 0.407 \text{ MW}$.

Example 2:

The phase A current (true RMS value) is to be monitored via the H2 current output working with the range from 4 to 20 mA. The CT ratio is 5000:5 and the maximum load current is 4200 A. The current should be monitored from 0 A upwards, allowing for 50% overload.

The phase current with the 50% overload margin is:

$$I_{max} = 1.5 \times 4.2 \text{ kA} = 6.3 \text{ kA} \tag{EQ 5.26}$$

The base unit for current (refer to the FlexElements section in this chapter for additional details) is:

$$I_{BASE} = 5 \text{ kA} \tag{EQ 5.27}$$

The minimum and maximum power values to be monitored (in pu) are:

$$\text{minimum current} = \frac{0 \text{ kA}}{5 \text{ kA}} = 0 \text{ pu}, \quad \text{maximum current} = \frac{6.3 \text{ kA}}{5 \text{ kA}} = 1.26 \text{ pu} \tag{EQ 5.28}$$

The following settings should be entered:

DCMA OUTPUT H2 SOURCE: "SRC 1 Ia RMS"
DCMA OUTPUT H2 RANGE: "4 to 20 mA"
DCMA OUTPUT H2 MIN VAL: "0.000 pu"
DCMA OUTPUT H2 MAX VAL: "1.260 pu"

The worst-case error for this application could be calculated by superimposing the following two sources of error:

- ±0.5% of the full scale for the analog output module, or $\pm 0.005 \times (20 - 4) \times 6.3$ kA $= \pm 0.504$ kA

- ±0.25% of reading or ±0.1% of rated (whichever is greater) for currents between 0.1 and 2.0 of nominal

For example, at the reading of 4.2 kA, the worst-case error is max(0.0025 × 4.2 kA, 0.001 × 5 kA) + 0.504 kA = 0.515 kA.

Example 3:

A positive-sequence voltage on a 400 kV system measured via Source 2 is to be monitored by the dcmA H3 output with a range of 0 to 1 mA. The VT secondary setting is 66.4 V, the VT ratio setting is 6024, and the VT connection setting is "Delta". The voltage should be monitored in the range from 70% to 110% of nominal.

The minimum and maximum positive-sequence voltages to be monitored are:

$$V_{min} = 0.7 \times \frac{400 \text{ kV}}{\sqrt{3}} = 161.66 \text{ kV}, \qquad V_{max} = 1.1 \times \frac{400 \text{ kV}}{\sqrt{3}} = 254.03 \text{ kV} \qquad \textbf{(EQ 5.29)}$$

The base unit for voltage (refer to the FlexElements section in this chapter for additional details) is:

$$V_{BASE} = 0.0664 \text{ kV} \times 6024 = 400 \text{ kV} \qquad \textbf{(EQ 5.30)}$$

The minimum and maximum voltage values to be monitored (in pu) are:

$$\text{minimum voltage} = \frac{161.66 \text{ kV}}{400 \text{ kV}} = 0.404 \text{ pu}, \quad \text{maximum voltage} = \frac{254.03 \text{ kV}}{400 \text{ kV}} = 0.635 \text{ pu} \qquad \textbf{(EQ 5.31)}$$

The following settings should be entered:

DCMA OUTPUT H3 SOURCE: "SRC 2 V_1 mag"
DCMA OUTPUT H3 RANGE: "0 to 1 mA"
DCMA OUTPUT H3 MIN VAL: "0.404 pu"
DCMA OUTPUT H3 MAX VAL: "0.635 pu"

The limit settings differ from the expected 0.7 pu and 1.1 pu because the relay calculates the positive-sequence quantities scaled to the phase-to-ground voltages, even if the VTs are connected in "Delta" (refer to the *Metering Conventions* section in Chapter 6), while at the same time the VT nominal voltage is 1 pu for the settings. Consequently the settings required in this example differ from naturally expected by the factor of $\sqrt{3}$.

The worst-case error for this application could be calculated by superimposing the following two sources of error:

- ±0.5% of the full scale for the analog output module, or $\pm 0.005 \times (1 - 0) \times 254.03$ kV $= \pm 1.27$ kV

- ±0.5% of reading

For example, under nominal conditions, the positive-sequence reads 230.94 kV and the worst-case error is 0.005 x 230.94 kV + 1.27 kV = 2.42 kV.

5.9.1 TEST MODE

PATH: SETTINGS ⇨⇩ TESTING ⇨ TEST MODE

```
■■  SETTINGS                         TEST MODE              Range:  Disabled, Enabled
■■  TESTING           ◄I►            FUNCTION: Disabled

                                     TEST MODE INITIATE:    Range:  FlexLogic™ operand
          MESSAGE     ▲              On
```
The relay provides test settings to verify that functionality using simulated conditions for contact inputs and outputs. The test mode is indicated on the relay faceplate by a flashing Test Mode LED indicator.

To initiate the Test mode, the **TEST MODE FUNCTION** setting must be "Enabled" and the **TEST MODE INITIATE** setting must be set to logic 1. In particular:

• To initiate Test Mode through relay settings, set **TEST MODE INITIATE** to "On". The test mode starts when the **TEST MODE FUNCTION** setting is changed from "Disabled" to "Enabled".

• To initiate test mode through a user-programmable condition, such as FlexLogic™ operand (pushbutton, digital input, communication-based input, or a combination of these), set **TEST MODE FUNCTION** to "Enabled" and set **TEST MODE INITIATE** to the desired operand. The test mode starts when the selected operand assumes a logic 1 state.

When in test mode, the C60 remains fully operational, allowing for various testing procedures. In particular, the protection and control elements, FlexLogic™, and communication-based inputs and outputs function normally.

The only difference between the normal operation and the test mode is the behavior of the input and output contacts. The former can be forced to report as open or closed or remain fully operational; the latter can be forced to open, close, freeze, or remain fully operational. The response of the digital input and output contacts to the test mode is programmed individually for each input and output using the force contact inputs and force contact outputs test functions described in the following sections.

5.9.2 FORCE CONTACT INPUTS

PATH: SETTINGS ⇨⇩ TESTING ⇨⇩ FORCE CONTACT INPUTS

```
■  FORCE CONTACT                     FORCE Cont Ip 1        Range:  Disabled, Open, Closed
■  INPUTS             ◄I►            :Disabled

                                     FORCE Cont Ip 2        Range:  Disabled, Open, Closed
          MESSAGE     ▲▼             :Disabled

                            ↓

                                     FORCE Cont Ip xx       Range:  Disabled, Open, Closed
          MESSAGE     ▲              :Disabled
```
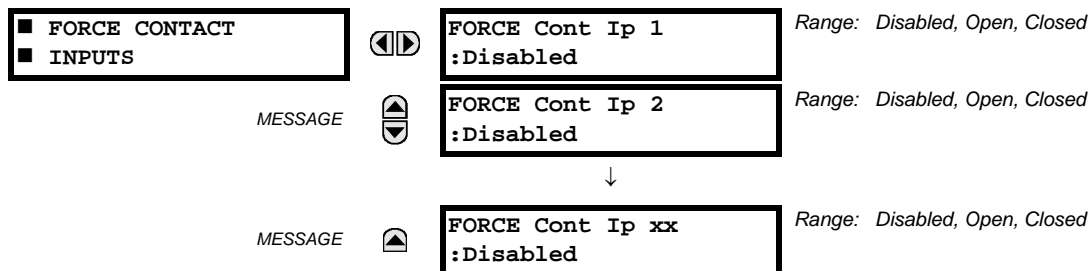

The relay digital inputs (contact inputs) could be pre-programmed to respond to the test mode in the following ways:

• If set to "Disabled", the input remains fully operational. It is controlled by the voltage across its input terminals and can be turned on and off by external circuitry. This value should be selected if a given input must be operational during the test. This includes, for example, an input initiating the test, or being a part of a user pre-programmed test sequence.

• If set to "Open", the input is forced to report as opened (Logic 0) for the entire duration of the test mode regardless of the voltage across the input terminals.

• If set to "Closed", the input is forced to report as closed (Logic 1) for the entire duration of the test mode regardless of the voltage across the input terminals.

The force contact inputs feature provides a method of performing checks on the function of all contact inputs. Once enabled, the relay is placed into test mode, allowing this feature to override the normal function of contact inputs. The Test Mode LED will be on, indicating that the relay is in test mode. The state of each contact input may be programmed as "Disabled", "Open", or "Closed". All contact input operations return to normal when all settings for this feature are disabled.

PATH: SETTINGS ⇨⇩ TESTING ⇨⇩ FORCE CONTACT OUTPUTS

```
■ FORCE CONTACT          ◀▶        FORCE Cont Op 1        Range:  Disabled, Energized, De-energized, Freeze
■ OUTPUTS                          :Disabled
```

```
MESSAGE         ▲        FORCE Cont Op 2        Range:  Disabled, Energized, De-energized, Freeze
                ▼        :Disabled
```

↓

```
MESSAGE         ▲        FORCE Cont Op xx       Range:  Disabled, Energized, De-energized, Freeze
                         :Disabled
```
The relay contact outputs can be pre-programmed to respond to the test mode.

If set to "Disabled", the contact output remains fully operational. If operates when its control operand is logic 1 and will resets when its control operand is logic 0. If set to "Energized", the output will close and remain closed for the entire duration of the test mode, regardless of the status of the operand configured to control the output contact. If set to "De-energized", the output will open and remain opened for the entire duration of the test mode regardless of the status of the operand configured to control the output contact. If set to "Freeze", the output retains its position from before entering the test mode, regardless of the status of the operand configured to control the output contact.

These settings are applied two ways. First, external circuits may be tested by energizing or de-energizing contacts. Second, by controlling the output contact state, relay logic may be tested and undesirable effects on external circuits avoided.

Example 1: Initiating test mode through user-programmable pushbutton 1

For example, the test mode can be initiated from user-programmable pushbutton 1. The pushbutton will be programmed as "Latched" (pushbutton pressed to initiate the test, and pressed again to terminate the test). During the test, digital input 1 should remain operational, digital inputs 2 and 3 should open, and digital input 4 should close. Also, contact output 1 should freeze, contact output 2 should open, contact output 3 should close, and contact output 4 should remain fully operational. The required settings are shown below.

To enable user-programmable pushbutton 1 to initiate the test mode, make the following changes in the **SETTINGS ⇨⇩ TESTING ⇨ TEST MODE** menu: **TEST MODE FUNCTION:** "Enabled" and **TEST MODE INITIATE:** "PUSHBUTTON 1 ON"

Make the following changes to configure the contact inputs and outputs. In the **SETTINGS ⇨⇩ TESTING ⇨⇩ FORCE CONTACT INPUTS** and **FORCE CONTACT OUTPUTS** menus, set:

> **FORCE Cont Ip 1:** "Disabled", **FORCE Cont Ip 2:** "Open", **FORCE Cont Ip 3:** "Open", and **FORCE Cont Ip 4:** "Closed"
> **FORCE Cont Op 1:** "Freeze", **FORCE Cont Op 2:** "De-energized", **FORCE Cont Op 3:** "Energized",
>   and **FORCE Cont Op 4:** "Disabled"

Example 2: Initiating a test from user-programmable pushbutton 1 or through remote input 1

In this example, the test can be initiated locally from user-programmable pushbutton 1 or remotely through remote input 1. Both the pushbutton and the remote input will be programmed as "Latched". Write the following FlexLogic™ equation:

Set the user-programmable pushbutton as latching by changing **SETTINGS ⇨ PRODUCT SETUP ⇨⇩ USER-PROGRAMMABLE PUSHBUTTONS ⇨ USER PUSHBUTTON 1 ⇨ PUSHBUTTON 1 FUNCTION** to "Latched". To enable either pushbutton 1 or remote input 1 to initiate the Test mode, make the following changes in the **SETTINGS ⇨⇩ TESTING ⇨ TEST MODE** menu:

> **TEST MODE FUNCTION:** "Enabled" and **TEST MODE INITIATE:** "VO1"

The present state of up to 96 virtual outputs is shown here. The first line of a message display indicates the ID of the virtual output. For example, 'Virt Op 1' refers to the virtual output in terms of the default name-array index. The second line of the display indicates the logic state of the virtual output, as calculated by the FlexLogic™ equation for that output.

6.2.7 AUTORECLOSE

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ AUTORECLOSE

```
■ AUTORECLOSE              ◀▶    AUTORECLOSE         Range:  0, 1, 2, 3, 4
■                                 SHOT COUNT:     0
```
The automatic reclosure shot count is shown here.

6.2.8 REMOTE DEVICES

a) STATUS

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ REMOTE DEVICES STATUS

```
■ REMOTE DEVICES           ◀▶    All REMOTE DEVICES   Range:  Yes, No
■ STATUS                          ONLINE: No

                  MESSAGE   ▲     REMOTE DEVICE  1     Range:  Online, Offline
                           ▼      STATUS: Offline

                  MESSAGE   ▲     REMOTE DEVICE  2     Range:  Online, Offline
                           ▼      STATUS: Offline

                                        ↓

                  MESSAGE   ▲     REMOTE DEVICE 16     Range:  Online, Offline
                                  STATUS: Offline
```
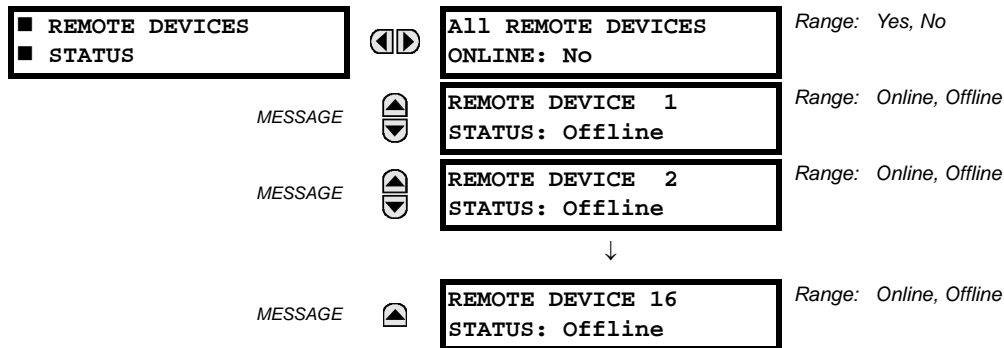

The present state of up to 16 programmed remote devices is shown here. The **ALL REMOTE DEVICES ONLINE** message indicates whether or not all programmed remote devices are online. If the corresponding state is "No", then at least one required remote device is not online.

b) STATISTICS

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ REMOTE DEVICES STATISTICS ⇨ REMOTE DEVICE 1(16)

```
■ REMOTE DEVICE  1         ◀▶    REMOTE DEVICE  1
■                                 StNum:          0

                  MESSAGE   ▲     REMOTE DEVICE  1
                                  SqNum:          0
```
Statistical data (two types) for up to 16 programmed remote devices is shown here.

The **StNum** number is obtained from the indicated remote device and is incremented whenever a change of state of at least one DNA or UserSt bit occurs. The **SqNum** number is obtained from the indicated remote device and is incremented whenever a GSSE message is sent. This number will rollover to zero when a count of 4 294 967 295 is incremented.

6

6.2.9 DIGITAL COUNTERS

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ DIGITAL COUNTERS ⇨ DIGITAL COUNTERS Counter 1(8)

```
■ DIGITAL COUNTERS          Counter 1      ACCUM:
■ Counter 1                             0
```

```
              MESSAGE        Counter 1      FROZEN:
                                        0
```

```
              MESSAGE        Counter 1      FROZEN:
                            YYYY/MM/DD HH:MM:SS
```

```
              MESSAGE        Counter 1      MICROS:
                                        0
```

The present status of the eight digital counters is shown here. The status of each counter, with the user-defined counter name, includes the accumulated and frozen counts (the count units label will also appear). Also included, is the date and time stamp for the frozen count. The **COUNTER 1 MICROS** value refers to the microsecond portion of the time stamp.

6.2.10 SELECTOR SWITCHES

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ SELECTOR SWITCHES

```
■ SELECTOR SWITCHES         SELECTOR SWITCH 1         Range:  Current Position / 7
■                           POSITION: 0/7
```

```
              MESSAGE        SELECTOR SWITCH 2         Range:  Current Position / 7
                            POSITION: 0/7
```

The display shows both the current position and the full range. The current position only (an integer from 0 through 7) is the actual value.

6.2.11 FLEX STATES

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ FLEX STATES

```
■ FLEX STATES               PARAM   1: Off            Range:  Off, On
■                           Off
```

```
              MESSAGE        PARAM   2: Off            Range:  Off, On
                            Off
```

```
                                      ↓
```

```
              MESSAGE        PARAM 256: Off            Range:  Off, On
                            Off
```

There are 256 FlexState bits available. The second line value indicates the state of the given FlexState bit.

6.2.12 ETHERNET

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ ETHERNET

```
■ ETHERNET                  ETHERNET PRI LINK         Range:  Fail, OK
■                           STATUS: OK
```

```
              MESSAGE        ETHERNET SEC LINK         Range:  Fail, OK
                            STATUS: OK
```

These values indicate the status of the primary and secondary Ethernet links.

PATH: ACTUAL VALUES ⇨ **STATUS** ⇨⇩ **DIRECT INPUTS**

```
■ DIRECT INPUTS          ◁▷   AVG MSG RETURN
■                              TIME CH1: 0 ms

              MESSAGE     ▲▼   UNRETURNED MSG
                               COUNT CH1: 0

              MESSAGE     ▲▼   CRC FAIL COUNT
                               CH1: 0

              MESSAGE     ▲▼   AVG MSG RETURN
                               TIME CH2: 0 ms

              MESSAGE     ▲▼   UNRETURNED MSG
                               COUNT CH2: 0

              MESSAGE     ▲▼   CRC FAIL COUNT
                               CH2: 0

              MESSAGE     ▲▼   DIRECT INPUT  1:
                               On

              MESSAGE     ▲▼   DIRECT INPUT  2:
                               On

                                     ↓

              MESSAGE     ▲    DIRECT INPUT 32:
                               On
```
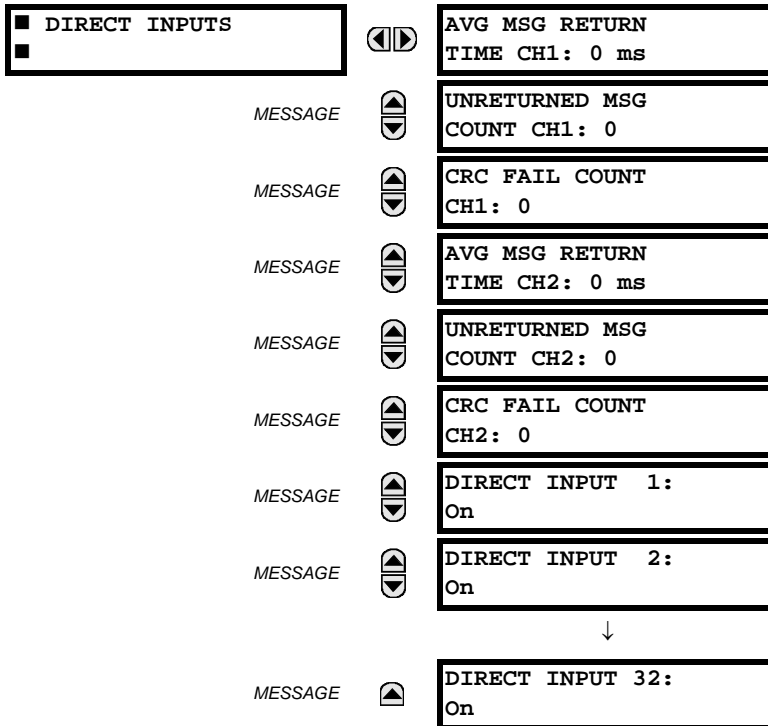

The **AVERAGE MSG RETURN TIME** is the time taken for direct output messages to return to the sender in a direct input/output ring configuration (this value is not applicable for non-ring configurations). This is a rolling average calculated for the last ten messages. There are two return times for dual-channel communications modules.

The **UNRETURNED MSG COUNT** values (one per communications channel) count the direct output messages that do not make the trip around the communications ring. The **CRC FAIL COUNT** values (one per communications channel) count the direct output messages that have been received but fail the CRC check. High values for either of these counts may indicate on a problem with wiring, the communication channel, or one or more relays. The **UNRETURNED MSG COUNT** and **CRC FAIL COUNT** values can be cleared using the **CLEAR DIRECT I/O COUNTERS** command.

The **DIRECT INPUT 1** to **DIRECT INPUT (32)** values represent the state of each direct input.

6.2.14 DIRECT DEVICES STATUS

PATH: ACTUAL VALUES ⇨ **STATUS** ⇨⇩ **DIRECT DEVICES STATUS**

```
■ DIRECT DEVICES         ◁▷   DIRECT DEVICE 1       Range:  Offline, Online
■ STATUS                       STATUS: Offline

              MESSAGE     ▲▼   DIRECT DEVICE 2       Range:  Offline, Online
                               STATUS: Offline

                                     ↓

              MESSAGE     ▲    DIRECT DEVICE 16      Range:  Offline, Online
                               STATUS: Offline
```
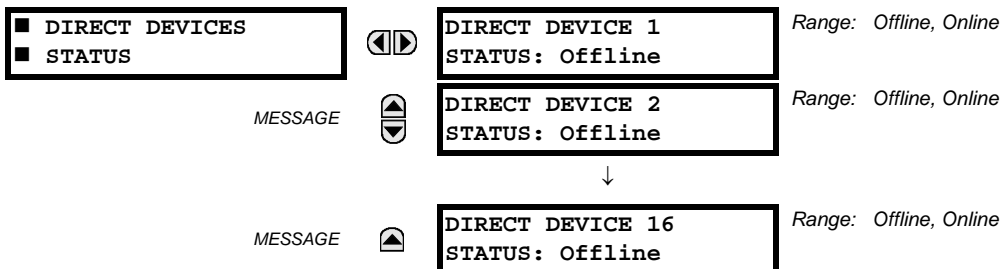

These actual values represent the state of direct devices 1 through 16.

6.2.15 EGD PROTOCOL STATUS

a) FAST EXCHANGE

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ EGD PROTOCOL STATUS ⇨ PRODUCER STATUS ⇨ FAST EXCHANGE 1

```
■ FAST EXCHANGE 1
■
```
◄□►
```
FAST EXCHANGE 1
SIGNATURE:  0
```

MESSAGE ⬆
```
FAST EXCHANGE 1
DATA LENGTH:  0
```

These values provide information that may be useful for debugging an EGD network. The EGD signature and packet size for the fast EGD exchange is displayed.

b) SLOW EXCHANGE

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ EGD PROTOCOL STATUS ⇨ PRODUCER STATUS ⇨⇩ SLOW EXCHANGE 1(2)

```
■ SLOW EXCHANGE 1
■
```
◄□►
```
SLOW EXCHANGE 1
SIGNATURE:  0
```

MESSAGE ⬆
```
SLOW EXCHANGE 1
DATA LENGTH:  0
```

These values provide information that may be useful for debugging an EGD network. The EGD signature and packet size for the slow EGD exchanges are displayed.

6.2.16 TELEPROTECTION CHANNEL TESTS

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ TELEPROT CH TESTS

```
■ TELEPROT CH TESTS
■
```
◄□►
```
CHANNEL 1
STATUS: n/a
```
Range: n/a, FAIL, OK

MESSAGE ⬍
```
CHANNEL 1 LOST
PACKETS:      1
```
Range: 1 to 65535 in steps of 1

MESSAGE ⬍
```
CHANNEL 2
STATUS: n/a
```
Range: n/a, FAIL, OK

MESSAGE ⬍
```
CHANNEL 2 LOST
PACKETS:      1
```
Range: 1 to 65535 in steps of 1

MESSAGE ⬆
```
VALIDITY OF CHANNEL
CONFIGURATION: FAIL
```
Range: n/a, FAIL, OK

The status information for two channels is shown here.

- **CHANNEL 1 STATUS**: This represents the receiver status of each channel. If the value is "OK", teleprotection is enabled and data is being received from the remote terminal; If the value is "FAIL", teleprotection enabled and data is not being received from the remote terminal. If "n/a", teleprotection is disabled.

- **CHANNEL 1 LOST PACKETS**: Data is transmitted to the remote terminals in data packets at a rate of two packets per cycle. The number of lost packets represents data packets lost in transmission; this count can be reset to 0 through the **COMMANDS ⇨⇩ CLEAR RECORDS** menu.

- **VALIDITY OF CHANNEL CONFIGURATION**: This value displays the current state of the communications channel identification check, and hence validity. If a remote relay ID does not match the programmed ID at the local relay, the "FAIL" message will be displayed. The "N/A" value appears if the local relay ID is set to a default value of "0", the channel is failed, or if the teleprotection inputs/outputs are not enabled.

PATH: ACTUAL VALUES ⇨ STATUS ⇨⇩ ETHERNET SWITCH

■ ETHERNET SWITCH ■	◁▷	SWITCH 1 PORT STATUS: OK	*Range: FAIL, OK*
	MESSAGE ⬆⬇	SWITCH 2 PORT STATUS: OK	*Range: FAIL, OK*
		↓	
	MESSAGE ⬆⬇	SWITCH 6 PORT STATUS: OK	*Range: FAIL, OK*
	MESSAGE ⬆	SWITCH MAC ADDRESS: 00A0F40138FA	*Range: standard MAC address format*
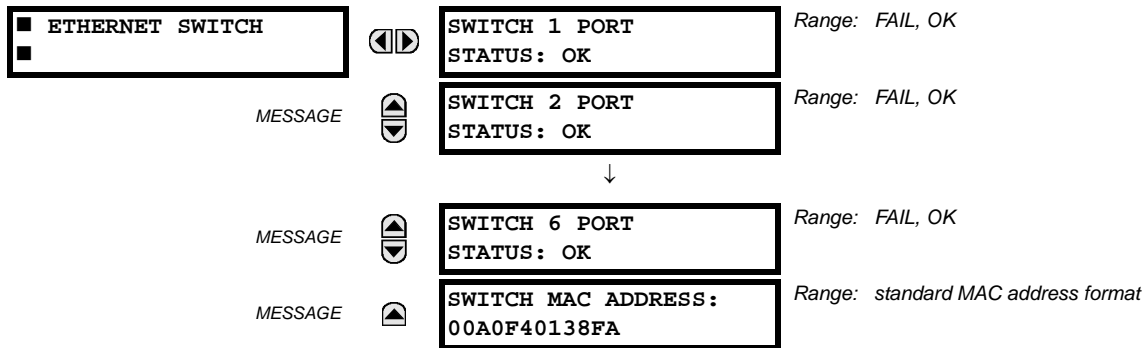

These actual values appear only if the C60 is ordered with an Ethernet switch module (type 2S or 2T). The status information for the Ethernet switch is shown in this menu.

- **SWITCH 1 PORT STATUS** to **SWITCH 6 PORT STATUS**: These values represents the receiver status of each port on the Ethernet switch. If the value is "OK", then data is being received from the remote terminal; If the value is "FAIL", then data is not being received from the remote terminal or the port is not connected.

- **SWITCH MAC ADDRESS**: This value displays the MAC address assigned to the Ethernet switch module.

a) UR CONVENTION FOR MEASURING POWER AND ENERGY

The following figure illustrates the conventions established for use in UR-series relays.
Figure 6–1: FLOW DIRECTION OF SIGNED VALUES FOR WATTS AND VARS

b) UR CONVENTION FOR MEASURING PHASE ANGLES

All phasors calculated by UR-series relays and used for protection, control and metering functions are rotating phasors that maintain the correct phase angle relationships with each other at all times.

For display and oscillography purposes, all phasor angles in a given relay are referred to an AC input channel pre-selected by the **SETTINGS** ⇨⇩ **SYSTEM SETUP** ⇨⇩ **POWER SYSTEM** ⇨⇩ **FREQUENCY AND PHASE REFERENCE** setting. This setting defines a particular AC signal source to be used as the reference.

The relay will first determine if any "Phase VT" bank is indicated in the source. If it is, voltage channel VA of that bank is used as the angle reference. Otherwise, the relay determines if any "Aux VT" bank is indicated; if it is, the auxiliary voltage channel of that bank is used as the angle reference. If neither of the two conditions is satisfied, then two more steps of this hierarchical procedure to determine the reference signal include "Phase CT" bank and "Ground CT" bank.

If the AC signal pre-selected by the relay upon configuration is not measurable, the phase angles are not referenced. The phase angles are assigned as positive in the leading direction, and are presented as negative in the lagging direction, to more closely align with power system metering conventions. This is illustrated below.
Figure 6–2: UR PHASE ANGLE MEASUREMENT CONVENTION

c) UR CONVENTION FOR MEASURING SYMMETRICAL COMPONENTS

The UR-series of relays calculate voltage symmetrical components for the power system phase A line-to-neutral voltage, and symmetrical components of the currents for the power system phase A current. Owing to the above definition, phase angle relations between the symmetrical currents and voltages stay the same irrespective of the connection of instrument transformers. This is important for setting directional protection elements that use symmetrical voltages.

For display and oscillography purposes the phase angles of symmetrical components are referenced to a common reference as described in the previous sub-section.

WYE-CONNECTED INSTRUMENT TRANSFORMERS:

- ABC phase rotation:

$$V\_0 = \frac{1}{3}(V_{AG} + V_{BG} + V_{CG})$$

$$V\_1 = \frac{1}{3}(V_{AG} + a V_{BG} + a^2 V_{CG})$$

$$V\_2 = \frac{1}{3}(V_{AG} + a^2 V_{BG} + a V_{CG})$$

- ACB phase rotation:

$$V\_0 = \frac{1}{3}(V_{AG} + V_{BG} + V_{CG})$$

$$V\_1 = \frac{1}{3}(V_{AG} + a^2 V_{BG} + a V_{CG})$$

$$V\_2 = \frac{1}{3}(V_{AG} + a V_{BG} + a^2 V_{CG})$$

The above equations apply to currents as well.

DELTA-CONNECTED INSTRUMENT TRANSFORMERS:

- ABC phase rotation:

$$V\_0 = \text{N/A}$$

$$V\_1 = \frac{1\angle{-30°}}{3\sqrt{3}}(V_{AB} + aV_{BC} + a^2V_{CA})$$

$$V\_2 = \frac{1\angle{30°}}{3\sqrt{3}}(V_{AB} + a^2V_{BC} + aV_{CA})$$

- ACB phase rotation:

$$V\_0 = \text{N/A}$$

$$V\_1 = \frac{1\angle{30°}}{3\sqrt{3}}(V_{AB} + a^2V_{BC} + aV_{CA})$$

$$V\_2 = \frac{1\angle{-30°}}{3\sqrt{3}}(V_{AB} + aV_{BC} + a^2V_{CA})$$

The zero-sequence voltage is not measurable under the Delta connection of instrument transformers and is defaulted to zero. The table below shows an example of symmetrical components calculations for the ABC phase rotation.

Table 6–1: SYMMETRICAL COMPONENTS CALCULATION EXAMPLE

SYSTEM VOLTAGES, SEC. V *						VT CONN.	RELAY INPUTS, SEC. V			SYMM. COMP, SEC. V		
V_{AG}	V_{BG}	V_{CG}	V_{AB}	V_{BC}	V_{CA}		F5AC	F6AC	F7AC	V_0	V_1	V_2
13.9 $\angle0°$	76.2 $\angle{-125°}$	79.7 $\angle{-250°}$	84.9 $\angle{-313°}$	138.3 $\angle{-97°}$	85.4 $\angle{-241°}$	WYE	13.9 $\angle0°$	76.2 $\angle{-125°}$	79.7 $\angle{-250°}$	19.5 $\angle{-192°}$	56.5 $\angle{-7°}$	23.3 $\angle{-187°}$
UNKNOWN (only V_1 and V_2 can be determined)			84.9 $\angle0°$	138.3 $\angle{-144°}$	85.4 $\angle{-288°}$	DELTA	84.9 $\angle0°$	138.3 $\angle{-144°}$	85.4 $\angle{-288°}$	N/A	56.5 $\angle{-54°}$	23.3 $\angle{-234°}$

*   The power system voltages are phase-referenced – for simplicity – to *VAG* and *VAB*, respectively. This, however, is a relative matter. It is important to remember that the C60 displays are always referenced as specified under **SETTINGS** ⇨⇩ **SYSTEM SETUP** ⇨⇩ **POWER SYSTEM** ⇨⇩ **FREQUENCY AND PHASE REFERENCE**.

The example above is illustrated in the following figure.
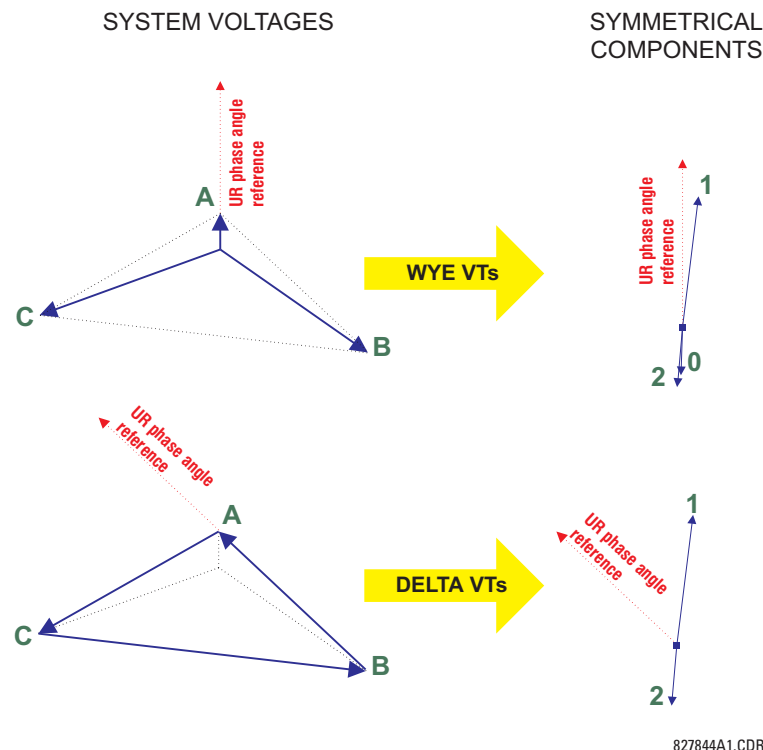

Figure 6–3: MEASUREMENT CONVENTION FOR SYMMETRICAL COMPONENTS

MESSAGE	⬆	`SRC 1   DMD VA DATE:` `2001/07/31 16:30:07`

The metered values for current and power demand are displayed in this menu. The "SRC 1" text will be replaced by what-
ever name was programmed by the user for the associated source (see **SETTINGS** ⇨⇩ **SYSTEM SETUP** ⇨⇩ **SIGNAL
SOURCES**).

The relay measures (absolute values only) the source demand on each phase and average three phase demand for real,
reactive, and apparent power. These parameters can be monitored to reduce supplier demand penalties or for statistical
metering purposes. Demand calculations are based on the measurement type selected in the **SETTINGS** ⇨ **PRODUCT SETUP**
⇨⇩ **DEMAND** menu. For each quantity, the relay displays the demand over the most recent demand time interval, the maxi-
mum demand since the last maximum demand reset, and the time and date stamp of this maximum demand value. Maxi-
mum demand quantities can be reset to zero with the **CLEAR RECORDS** ⇨⇩ **CLEAR DEMAND RECORDS** command.

i) FREQUENCY METERING

PATH: ACTUAL VALUES ⇨⇩ **METERING** ⇨ **SOURCE SRC 1** ⇨⇩ **FREQUENCY**

`■ FREQUENCY` `■ SRC 1`	◀▶	`SRC 1   FREQUENCY:` `   0.00 Hz`

The metered frequency values are displayed in this menu. The "SRC 1" text will be replaced by whatever name was pro-
grammed by the user for the associated source (see **SETTINGS** ⇨⇩ **SYSTEM SETUP** ⇨⇩ **SIGNAL SOURCES**).

SOURCE FREQUENCY is measured via software-implemented zero-crossing detection of an AC signal. The signal is either a
Clarke transformation of three-phase voltages or currents, auxiliary voltage, or ground current as per source configuration
(see the **SYSTEM SETUP** ⇨⇩ **POWER SYSTEM** settings). The signal used for frequency estimation is low-pass filtered. The
final frequency measurement is passed through a validation filter that eliminates false readings due to signal distortions and
transients.

6.3.3 SYNCHROCHECK

PATH: ACTUAL VALUES ⇨⇩ **METERING** ⇨⇩ **SYNCHROCHECK** ⇨ **SYNCHROCHECK 1(2)**

```
■ SYNCHROCHECK 1                        SYNCHROCHECK 1 DELTA
■                      ◀▮▶              VOLT:  0.000 V
```

```
           MESSAGE      ▲              SYNCHROCHECK 1 DELTA
                        ▼              PHASE:     0.0°
```

```
           MESSAGE      ▲              SYNCHROCHECK 1 DELTA
                                       FREQ:    0.00 Hz
```

The actual values menu for synchrocheck 2 is identical to that of synchrocheck 1. If a synchrocheck function setting is "Disabled", the corresponding actual values menu item will not be displayed.

6.3.4 TRACKING FREQUENCY

PATH: ACTUAL VALUES ⇨⇩ **METERING** ⇨⇩ **TRACKING FREQUENCY**

```
■ TRACKING FREQUENCY                    TRACKING FREQUENCY:
■                      ◀▮▶              60.00 Hz
```

The tracking frequency is displayed here. The frequency is tracked based on the selection of the reference source with the **FREQUENCY AND PHASE REFERENCE** setting in the **SETTINGS** ⇨⇩ **SYSTEM SETUP** ⇨⇩ **POWER SYSTEM** menu. Refer to the *Power System* section of chapter 5 for additional details.

6.3.5 FLEXELEMENTS™

PATH: ACTUAL VALUES ⇨⇩ **METERING** ⇨⇩ **FLEXELEMENTS** ⇨ **FLEXELEMENT 1(8)**

```
■ FLEXELEMENT 1                         FLEXELEMENT 1
■                      ◀▮▶              OpSig: 0.000 pu
```

The operating signals for the FlexElements™ are displayed in pu values using the following definitions of the base units.

Table 6–2: FLEXELEMENT™ BASE UNITS

BREAKER ARCING AMPS (Brk X Arc Amp A, B, and C)	BASE = 2000 kA^2 × cycle
dcmA	BASE = maximum value of the **DCMA INPUT MAX** setting for the two transducers configured under the +IN and –IN inputs.
FREQUENCY	f_{BASE} = 1 Hz
PHASE ANGLE	φ_{BASE} = 360 degrees (see the UR angle referencing convention)
POWER FACTOR	PF_{BASE} = 1.00
RTDs	BASE = 100°C
SENSITIVE DIR POWER (Sns Dir Power)	P_{BASE} = maximum value of $3 \times V_{BASE} \times I_{BASE}$ for the +IN and –IN inputs of the sources configured for the sensitive power directional element(s).
SOURCE CURRENT	I_{BASE} = maximum nominal primary RMS value of the +IN and –IN inputs
SOURCE ENERGY (SRC X Positive and Negative Watthours); (SRC X Positive and Negative Varhours)	E_{BASE} = 10000 MWh or MVAh, respectively
SOURCE POWER	P_{BASE} = maximum value of $V_{BASE} \times I_{BASE}$ for the +IN and –IN inputs
SOURCE VOLTAGE	V_{BASE} = maximum nominal primary RMS value of the +IN and –IN inputs
SYNCHROCHECK (Max Delta Volts)	V_{BASE} = maximum primary RMS value of all the sources related to the +IN and –IN inputs

6.3.6 IEC 61580 GOOSE ANALOG VALUES

PATH: ACTUAL VALUES ⇨⇩ METERING ⇨⇩ IEC 61850 GOOSE ANALOGS

```
■ IEC 61850          ◁▷   ANALOG INPUT   1
■ GOOSE ANALOGS            0.000

            MESSAGE  ⬍    ANALOG INPUT   2
                           0.000

                     ↓

            MESSAGE  ⬆    ANALOG INPUT  16
                           0.000
```

The C60 Breaker Protection System is provided with optional IEC 61850 communications capability. This feature is specified as a software option at the time of ordering. Refer to the *Ordering* section of chapter 2 for additional details. The IEC 61850 protocol features are not available if CPU type E is ordered.

The IEC 61850 GGIO3 analog input data points are displayed in this menu. The GGIO3 analog data values are received via IEC 61850 GOOSE messages sent from other devices.

6.3.7 SENSITIVE DIRECTIONAL POWER

PATH: ACTUAL VALUES ⇨⇩ METERING ⇨⇩ SENSITIVE DIRECTIONAL POWER

```
■ SENSITIVE          ◁▷   DIRECTIONAL POWER 1
■ DIRECTIONAL POWER        3Φ: 0.000 W

            MESSAGE  ⬆    DIRECTIONAL POWER 2
                           3Φ: 0.000 W
```

The effective operating quantities of the sensitive directional power elements are displayed here. The display may be useful to calibrate the feature by compensating the angular errors of the CTs and VTs with the use of the **RCA** and **CALIBRATION** settings.

6.3.8 TRANSDUCER INPUTS/OUTPUTS

PATH: ACTUAL VALUES ⇨⇩ METERING ⇨⇩ TRANSDUCER I/O DCMA INPUTS ⇨ DCMA INPUT xx

```
■ DCMA INPUT xx      ◁▷   DCMA INPUT xx
■                          0.000 mA
```

Actual values for each dcmA input channel that is enabled are displayed with the top line as the programmed channel ID and the bottom line as the value followed by the programmed units.

PATH: ACTUAL VALUES ⇨⇩ METERING ⇨⇩ TRANSDUCER I/O RTD INPUTS ⇨ RTD INPUT xx

```
■ RTD INPUT xx       ◁▷   RTD INPUT xx
■                          -50 °C
```

Actual values for each RTD input channel that is enabled are displayed with the top line as the programmed channel ID and the bottom line as the value.

                                       └─────────────────────────────┘
```

The event records menu shows the contextual data associated with up to the last 1024 events, listed in chronological order from most recent to oldest. If all 1024 event records have been filled, the oldest record will be removed as a new record is added. Each event record shows the event identifier/sequence number, cause, and date/time stamp associated with the event trigger. Refer to the **COMMANDS ⇩ CLEAR RECORDS** menu for clearing event records.

6.4.3 OSCILLOGRAPHY

PATH: ACTUAL VALUES ⇨⇩ RECORDS ⇨⇩ OSCILLOGRAPHY

■ OSCILLOGRAPHY ■	◄▷	FORCE TRIGGER? No	*Range: No, Yes*
	MESSAGE ⬆⬇	NUMBER OF TRIGGERS: 0	
	MESSAGE ⬆⬇	AVAILABLE RECORDS: 0	
	MESSAGE ⬆⬇	CYCLES PER RECORD: 0.0	
	MESSAGE ⬆	LAST CLEARED DATE: 2000/07/14 15:40:16	

This menu allows the user to view the number of triggers involved and number of oscillography traces available. The **CYCLES PER RECORD** value is calculated to account for the fixed amount of data storage for oscillography. See the *Oscillography* section of chapter 5 for additional details.

A trigger can be forced here at any time by setting "Yes" to the **FORCE TRIGGER?** command. Refer to the **COMMANDS ⇨⇩ CLEAR RECORDS** menu for information on clearing the oscillography records.

6.4.4 DATA LOGGER

PATH: ACTUAL VALUES ⇨⇩ RECORDS ⇨⇩ DATA LOGGER

■ DATA LOGGER ■	◄▷	OLDEST SAMPLE TIME: 2000/01/14 13:45:51
	MESSAGE ⬆	NEWEST SAMPLE TIME: 2000/01/14 15:21:19

The **OLDEST SAMPLE TIME** represents the time at which the oldest available samples were taken. It will be static until the log gets full, at which time it will start counting at the defined sampling rate. The **NEWEST SAMPLE TIME** represents the time the most recent samples were taken. It counts up at the defined sampling rate. If the data logger channels are defined, then both values are static.

Refer to the **COMMANDS ⇨⇩ CLEAR RECORDS** menu for clearing data logger records.

PATH: ACTUAL VALUES ⇨⇩ **RECORDS** ⇨⇩ **MAINTENANCE** ⇨ **BREAKER 1(4)**

```

There is an identical menu for each of the breakers. The **BKR 1 ARCING AMP** values are in units of kA^2-cycles. Refer to the **COMMANDS** ⇨⇩ **CLEAR RECORDS** menu for clearing breaker arcing current records. The **BREAKER OPERATING TIME** is defined as the slowest operating time of breaker poles that were initiated to open.

6

```
*Range: No, Yes*

This menu contains commands for relay maintenance purposes. Commands are activated by changing a command setting to "Yes" and pressing the ENTER key. The command setting will then automatically revert to "No".

The **PERFORM LAMPTEST** command turns on all faceplate LEDs and display pixels for a short duration. The **UPDATE ORDER CODE** command causes the relay to scan the backplane for the hardware modules and update the order code to match. If an update occurs, the following message is shown.

```
UPDATING...
PLEASE WAIT
```

There is no impact if there have been no changes to the hardware modules. When an update does not occur, the **ORDER CODE NOT UPDATED** message will be shown.

```
                        ┌─────────────────────────┐
                        │        TARGETS          │
                        │                         │
                        └─────────────────────────┘
                                    ⇩
MESSAGE    ⏷      ┌─────────────────────────┐    Displayed only if targets for this element are active.
                  │ DIGITAL ELEMENT  1:     │    Example shown.
                  │ LATCHED                 │
                  └─────────────────────────┘
MESSAGE    ⏶      ┌─────────────────────────┐    Displayed only if targets for this element are active.
           ⏷      │ DIGITAL ELEMENT 48:     │    Example shown.
                  │ LATCHED                 │
                  └─────────────────────────┘
MESSAGE    ⏶                      ↓
                                  ↓
```

The status of any active targets will be displayed in the targets menu. If no targets are active, the display will read **NO ACTIVE TARGETS**:

When there are no active targets, the first target to become active will cause the display to immediately default to that message. If there are active targets and the user is navigating through other messages, and when the default message timer times out (i.e. the keypad has not been used for a determined period of time), the display will again default back to the target message.

The range of variables for the target messages is described below. Phase information will be included if applicable. If a target message status changes, the status with the highest priority will be displayed.

Table 7–1: TARGET MESSAGE PRIORITY STATUS

PRIORITY	ACTIVE STATUS	DESCRIPTION
1	OP	element operated and still picked up
2	PKP	element picked up and timed out
3	LATCHED	element had operated but has dropped out

If a self test error is detected, a message appears indicating the cause of the error. For example **UNIT NOT PROGRAMMED** indicates that the minimal relay settings have not been programmed.

a) DESCRIPTION

The relay performs a number of self-test diagnostic checks to ensure device integrity. The two types of self-tests (major and minor) are listed in the tables below. When either type of self-test error occurs, the Trouble LED Indicator will turn on and a target message displayed. All errors record an event in the event recorder. Latched errors can be cleared by pressing the RESET key, providing the condition is no longer present.

Major self-test errors also result in the following:

• The critical fail relay on the power supply module is de-energized.

• All other output relays are de-energized and are prevented from further operation.

• The faceplate In Service LED indicator is turned off.

• A RELAY OUT OF SERVICE event is recorded.

b) MAJOR SELF-TEST ERROR MESSAGES

The major self-test errors are listed and described below.

```
MODULE FAILURE___:
Contact Factory (xxx)
```

- *Latched target message*: Yes.

- *Description of problem*: Module hardware failure detected.

- *How often the test is performed*: Module dependent.

- *What to do*: Contact the factory and supply the failure code noted in the display. The "xxx" text identifies the failed module (for example, F8L).

```
INCOMPATIBLE H/W:
Contact Factory (xxx)
```

- *Latched target message*: Yes.

- *Description of problem*: One or more installed hardware modules is not compatible with the C60 order code.

- *How often the test is performed*: Module dependent.

- *What to do*: Contact the factory and supply the failure code noted in the display. The "xxx" text identifies the failed module (for example, F8L).

```
EQUIPMENT MISMATCH:
with 2nd line detail
```

- *Latched target message*: No.

- *Description of problem*: The configuration of modules does not match the order code stored in the C60.

- *How often the test is performed*: On power up. Afterwards, the backplane is checked for missing cards every five seconds.

- *What to do*: Check all modules against the order code, ensure they are inserted properly, and cycle control power. If the problem persists, contact the factory.

```
FLEXLOGIC ERROR:
with 2nd line detail
```

- *Latched target message*: No.

- *Description of problem*: A FlexLogic™ equation is incorrect.

- *How often the test is performed*: The test is event driven, performed whenever FlexLogic™ equations are modified.

- *What to do*: Finish all equation editing and use self tests to debug any errors.

```
UNIT NOT PROGRAMMED:
Check Settings
```

- *Latched target message*: No.

- *Description of problem*: The **PRODUCT SETUP** ⇨⇩ **INSTALLATION** ⇨ **RELAY SETTINGS** setting indicates the C60 is not programmed.

- *How often the test is performed*: On power up and whenever the **PRODUCT SETUP** ⇨⇩ **INSTALLATION** ⇨ **RELAY SETTINGS** setting is altered.

- *What to do*: Program all settings and then set **PRODUCT SETUP** ⇨⇩ **INSTALLATION** ⇨ **RELAY SETTINGS** to "Programmed".

c) MINOR SELF-TEST ERROR MESSAGES

Most of the minor self-test errors can be disabled. Refer to the settings in the *User-programmable self-tests* section in chapter 5 for additional details.

```
MAINTENANCE ALERT:
Replace Battery
```

- *Latched target message*: Yes.

- *Description of problem*: The battery is not functioning.

- *How often the test is performed*: The battery is monitored every five seconds. The error message is displayed after 60 seconds if the problem persists.

- *What to do*: Replace the battery located in the power supply module (1H or 1L).

```
MAINTENANCE ALERT:
Direct I/O Ring Break
```

- *Latched target message*: No.

- *Description of problem*: Direct input and output settings are configured for a ring, but the connection is not in a ring.

- *How often the test is performed*: Every second.

- *What to do*: Check direct input and output configuration and wiring.

```
MAINTENANCE ALERT:
ENET MODULE OFFLINE
```

- *Latched target message*: No.

- *Description of problem*: The C60 has failed to detect the Ethernet switch.

- *How often the test is performed*: Monitored every five seconds. An error is issued after five consecutive failures.

- *What to do*: Check the C60 device and switch IP configuration settings. Check for incorrect UR port (port 7) settings on the Ethernet switch. Check the power to the switch.

```
MAINTENANCE ALERT:
ENET PORT # OFFLINE
```

- *Latched target message*: No.

- *Description of problem*: The Ethernet connection has failed for the specified port.

- *How often the test is performed*: Every five seconds.

- *What to do*: Check the Ethernet port connection on the switch.

```
MAINTENANCE ALERT:
**Bad IRIG-B Signal**
```

- *Latched target message*: No.

- *Description of problem*: A bad IRIG-B input signal has been detected.

- *How often the test is performed*: Monitored whenever an IRIG-B signal is received.

- *What to do*: Ensure the following:

  - The IRIG-B cable is properly connected.

  - Proper cable functionality (that is, check for physical damage or perform a continuity test).

  - The IRIG-B receiver is functioning.

  - Check the input signal level (it may be less than specification).

7

If none of these apply, then contact the factory.

```
MAINTENANCE ALERT:
Port ## Failure
```

- *Latched target message*: No.

- *Description of problem*: An Ethernet connection has failed.

- *How often the test is performed*: Monitored every five seconds.

- *What to do*: Check Ethernet connections. Port 1 is the primary port and port 2 is the secondary port.

```
MAINTENANCE ALERT:
SNTP Failure
```

- *Latched target message*: No.

- *Description of problem*: The SNTP server is not responding.

- *How often the test is performed*: Every 10 to 60 seconds.

- *What to do*: Check SNTP configuration and network connections.

```
MAINTENANCE ALERT:
4L Discrepancy
```

- *Latched target message*: No.

- *Description of problem*: A discrepancy has been detected between the actual and desired state of a latching contact output of an installed type "4L" module.

- *How often the test is performed*: Upon initiation of a contact output state change.

- *What to do*: Verify the state of the output contact and contact the factory if the problem persists.

```
MAINTENANCE ALERT:
GGIO Ind xxx oscill
```

- *Latched target message*: No.

- *Description of problem*: A data item in a configurable GOOSE data set is oscillating.

- *How often the test is performed*: Upon scanning of each configurable GOOSE data set.

- *What to do*: The "xxx" text denotes the data item that has been detected as oscillating. Evaluate all logic pertaining to this item.

```
DIRECT I/O FAILURE:
COMM Path Incomplete
```

- *Latched target message*: No.

- *Description of problem*: A direct device is configured but not connected.

- *How often the test is performed*: Every second.

- *What to do*: Check direct input and output configuration and wiring.

```
REMOTE DEVICE FAIL:
COMM Path Incomplete
```

- *Latched target message*: No.

- *Description of problem*: One or more GOOSE devices are not responding.

- *How often the test is performed*: Event driven. The test is performed when a device programmed to receive GOOSE messages stops receiving. This can be from 1 to 60 seconds, depending on GOOSE packets.

- *What to do*: Check GOOSE setup.

```
UNEXPECTED RESTART:
Press "RESET" key
```

- *Latched target message*: Yes.

- *Description of problem*: Abnormal restart from modules being removed or inserted while the C60 is powered-up, when there is an abnormal DC supply, or as a result of internal relay failure.

- *How often the test is performed*: Event driven.

- *What to do*: Contact the factory.

7

7

Fault type determination is required for calculation of fault location – the algorithm uses the angle between the negative and positive sequence components of the relay currents. To improve accuracy and speed of operation, the fault components of the currents are used; that is, the pre-fault phasors are subtracted from the measured current phasors. In addition to the angle relationships, certain extra checks are performed on magnitudes of the negative and zero-sequence currents.

The single-ended fault location method assumes that the fault components of the currents supplied from the local (A) and remote (B) systems are in phase. The figure below shows an equivalent system for fault location.

Figure 8–1: EQUIVALENT SYSTEM FOR FAULT LOCATION

The following equations hold true for this equivalent system.

$$V_A = m \cdot Z \cdot I_A + R_F \cdot (I_A + I_B)$$

(EQ 8.1)

where: m = sought pu distance to fault, Z = positive sequence impedance of the line.

The currents from the local and remote systems can be parted between their fault (F) and pre-fault load (pre) components:

$$I_A = I_{AF} + I_{Apre}$$

(EQ 8.2)

and neglecting shunt parameters of the line:

$$I_B = I_{BF} - I_{Apre}$$

(EQ 8.3)

Inserting the I_A and I_B equations into the V_A equation and solving for the fault resistance yields:

$$R_F = \frac{V_A - m \cdot Z \cdot I_A}{I_{AF} \cdot \left(1 + \dfrac{I_{BF}}{I_{AF}}\right)}$$

(EQ 8.4)

Assuming the fault components of the currents, I_{AF} and I_{BF} are in phase, and observing that the fault resistance, as impedance, does not have any imaginary part gives:

$$\mathrm{Im}\left(\frac{V_A - m \cdot Z \cdot I_A}{I_{AF}}\right) = 0$$

(EQ 8.5)

where: Im() represents the imaginary part of a complex number. Solving the above equation for the unknown m creates the following fault location algorithm:

$$m = \frac{\mathrm{Im}(V_A \cdot I_{AF}*)}{\mathrm{Im}(Z \cdot I_A \cdot I_{AF}*)}$$

(EQ 8.6)

where * denotes the complex conjugate and $I_{AF} = I_A - I_{Apre}$.

Depending on the fault type, appropriate voltage and current signals are selected from the phase quantities before applying the two equations above (the superscripts denote phases, the subscripts denote stations).

For AG faults:

$$V_A = V_A^A, \quad I_A = I_A^A + K_0 \cdot I_{0A}$$

(EQ 8.7)

8

For BG faults:

$$V_A = V_A^B, \quad I_A = I_A^B + K_0 \cdot I_{0A}$$

(EQ 8.8)

For CG faults:

$$V_A = V_A^C, \quad I_A = I_A^{BC} + K_0 \cdot I_{0A}$$

(EQ 8.9)

For AB and ABG faults:

$$V_A = V_A^A - V_A^B, \quad I_A = I_A^A - I_A^B$$

(EQ 8.10)

For BC and BCG faults:

$$V_A = V_A^B - V_A^C, \quad I_A = I_A^B - I_A^C$$

(EQ 8.11)

For CA and CAG faults:

$$V_A = V_A^C - V_A^A, \quad I_A = I_A^C - I_A^A$$

(EQ 8.12)

where K_0 is the zero sequence compensation factor (for the first six equations above)

For ABC faults, all three AB, BC, and CA loops are analyzed and the final result is selected based upon consistency of the results

The element calculates the distance to the fault (with m in miles or kilometers) and the phases involved in the fault.

The relay allows locating faults from delta-connected VTs. If the **FAULT REPORT 1 VT SUBSTITUTION** setting is set to "None", and the VTs are connected in wye, the fault location is performed based on the actual phase to ground voltages. If the VTs are connected in delta, fault location is suspended.

If the **FAULT REPORT 1 VT SUBSTITUTION** setting value is "V0" and the VTs are connected in a wye configuration, the fault location is performed based on the actual phase to ground voltages. If the VTs are connected in a delta configuration, fault location is performed based on the delta voltages and externally supplied neutral voltage:

$$V_A = \frac{1}{3}(V_N + V_{AB} - V_{CA})$$

$$V_B = \frac{1}{3}(V_N + V_{BC} - V_{AB})$$

$$V_B = \frac{1}{3}(V_N + V_{CA} - V_{BC})$$

(EQ 8.13)

If the **FAULT REPORT 1 VT SUBSTITUTION** setting value is "I0" and the VTs are connected in a wye configuration, the fault location is performed based on the actual phase to ground voltages. If the VTs are connected in a delta configuration, fault location is performed based on the delta voltages and zero-sequence voltage approximated based on the zero-sequence current:

$$V_A = \frac{1}{3}(V_{AB} - V_{CA}) - Z_{SYS0}I_0$$

$$V_B = \frac{1}{3}(V_{BC} - V_{AB}) - Z_{SYS0}I_0$$

$$V_B = \frac{1}{3}(V_{CA} - V_{BC}) - Z_{SYS0}I_0$$

(EQ 8.14)

where Z_{SYS0} is the equivalent zero-sequence impedance behind the relay as entered under the fault report setting menu.

B.1.1 INTRODUCTION

The UR-series relays support a number of communications protocols to allow connection to equipment such as personal computers, RTUs, SCADA masters, and programmable logic controllers. The Modicon Modbus RTU protocol is the most basic protocol supported by the UR. Modbus is available via RS232 or RS485 serial links or via ethernet (using the Modbus/TCP specification). The following description is intended primarily for users who wish to develop their own master communication drivers and applies to the serial Modbus RTU protocol. Note that:

- The UR always acts as a slave device, meaning that it never initiates communications; it only listens and responds to requests issued by a master computer.

- For Modbus®, a subset of the Remote Terminal Unit (RTU) protocol format is supported that allows extensive monitoring, programming, and control functions using read and write register commands.

B.1.2 PHYSICAL LAYER

The Modbus® RTU protocol is hardware-independent so that the physical layer can be any of a variety of standard hardware configurations including RS232 and RS485. The relay includes a faceplate (front panel) RS232 port and two rear terminal communications ports that may be configured as RS485, fiber optic, 10Base-T, or 10Base-F. Data flow is half-duplex in all configurations. See chapter 3 for details on communications wiring.

Each data byte is transmitted in an asynchronous format consisting of 1 start bit, 8 data bits, 1 stop bit, and possibly 1 parity bit. This produces a 10 or 11 bit data frame. This can be important for transmission through modems at high bit rates (11 bit data frames are not supported by many modems at baud rates greater than 300).

The baud rate and parity are independently programmable for each communications port. Baud rates of 300, 1200, 2400, 4800, 9600, 14400, 19200, 28800, 33600, 38400, 57600, or 115200 bps are available. Even, odd, and no parity are available. Refer to the *Communications* section of chapter 5 for further details.

The master device in any system must know the address of the slave device with which it is to communicate. The relay will not act on a request from a master if the address in the request does not match the relay's slave address (unless the address is the broadcast address – see below).

A single setting selects the slave address used for all ports, with the exception that for the faceplate port, the relay will accept any address when the Modbus® RTU protocol is used.

B.1.3 DATA LINK LAYER

Communications takes place in packets which are groups of asynchronously framed byte data. The master transmits a packet to the slave and the slave responds with a packet. The end of a packet is marked by *dead-time* on the communications line. The following describes general format for both transmit and receive packets. For exact details on packet formatting, refer to subsequent sections describing each function code.

Table B–1: MODBUS PACKET FORMAT

DESCRIPTION	SIZE
SLAVE ADDRESS	1 byte
FUNCTION CODE	1 byte
DATA	*N* bytes
CRC	2 bytes
DEAD TIME	3.5 bytes transmission time

- **SLAVE ADDRESS:** This is the address of the slave device that is intended to receive the packet sent by the master and to perform the desired action. Each slave device on a communications bus must have a unique address to prevent bus contention. All of the relay's ports have the same address which is programmable from 1 to 254; see chapter 5 for details. Only the addressed slave will respond to a packet that starts with its address. Note that the faceplate port is an exception to this rule; it will act on a message containing any slave address.

  A master transmit packet with slave address 0 indicates a broadcast command. All slaves on the communication link take action based on the packet, but none respond to the master. Broadcast mode is only recognized when associated with function code 05h. For any other function code, a packet with broadcast mode slave address 0 will be ignored.

B

- **FUNCTION CODE:** This is one of the supported functions codes of the unit which tells the slave what action to perform. See the *Supported Function Codes* section for complete details. An exception response from the slave is indicated by setting the high order bit of the function code in the response packet. See the *Exception Responses* section for further details.

- **DATA:** This will be a variable number of bytes depending on the function code. This may include actual values, settings, or addresses sent by the master to the slave or by the slave to the master.

- **CRC:** This is a two byte error checking code. The RTU version of Modbus® includes a 16-bit cyclic redundancy check (CRC-16) with every packet which is an industry standard method used for error detection. If a Modbus slave device receives a packet in which an error is indicated by the CRC, the slave device will not act upon or respond to the packet thus preventing any erroneous operations. See the *CRC-16 Algorithm* section for details on calculating the CRC.

- **DEAD TIME:** A packet is terminated when no data is received for a period of 3.5 byte transmission times (about 15 ms at 2400 bps, 2 ms at 19200 bps, and 300 µs at 115200 bps). Consequently, the transmitting device must not allow gaps between bytes longer than this interval. Once the dead time has expired without a new byte transmission, all slaves start listening for a new packet from the master except for the addressed slave.

B.1.4 CRC-16 ALGORITHM

The CRC-16 algorithm essentially treats the entire data stream (data bits only; start, stop and parity ignored) as one continuous binary number. This number is first shifted left 16 bits and then divided by a characteristic polynomial (11000000000000101B). The 16-bit remainder of the division is appended to the end of the packet, MSByte first. The resulting packet including CRC, when divided by the same polynomial at the receiver will give a zero remainder if no transmission errors have occurred. This algorithm requires the characteristic polynomial to be reverse bit ordered. The most significant bit of the characteristic polynomial is dropped, since it does not affect the value of the remainder.

A C programming language implementation of the CRC algorithm will be provided upon request.

Table B–2: CRC-16 ALGORITHM

SYMBOLS:	-->	data transfer
	A	16 bit working register
	Alow	low order byte of A
	Ahigh	high order byte of A
	CRC	16 bit CRC-16 result
	i,j	loop counters
	(+)	logical EXCLUSIVE-OR operator
	N	total number of data bytes
	Di	i-th data byte (i = 0 to N-1)
	G	16 bit characteristic polynomial = 1010000000000001 (binary) with MSbit dropped and bit order reversed
	shr (x)	right shift operator (th LSbit of x is shifted into a carry flag, a '0' is shifted into the MSbit of x, all other bits are shifted right one location)

ALGORITHM:	1.	FFFF (hex) --> A	
	2.	0 --> i	
	3.	0 --> j	
	4.	Di (+) Alow --> Alow	
	5.	j + 1 --> j	
	6.	shr (A)	
	7.	Is there a carry?	No: go to 8; Yes: G (+) A --> A and continue.
	8.	Is j = 8?	No: go to 5; Yes: continue
	9.	i + 1 --> i	
	10.	Is i = N?	No: go to 3; Yes: continue
	11.	A --> CRC	

Modbus® officially defines function codes from 1 to 127 though only a small subset is generally needed. The relay supports some of these functions, as summarized in the following table. Subsequent sections describe each function code in detail.

FUNCTION CODE		MODBUS DEFINITION	GE MULTILIN DEFINITION
HEX	DEC		
03	3	Read holding registers	Read actual values or settings
04	4	Read holding registers	Read actual values or settings
05	5	Force single coil	Execute operation
06	6	Preset single register	Store single setting
10	16	Preset multiple registers	Store multiple settings

B.2.2 READ ACTUAL VALUES OR SETTINGS (FUNCTION CODE 03/04H)

This function code allows the master to read one or more consecutive data registers (actual values or settings) from a relay. Data registers are always 16-bit (two-byte) values transmitted with high order byte first. The maximum number of registers that can be read in a single packet is 125. See the *Modbus memory map* table for exact details on the data registers.

Since some PLC implementations of Modbus only support one of function codes 03h and 04h. The C60 interpretation allows either function code to be used for reading one or more consecutive data registers. The data starting address will determine the type of data being read. Function codes 03h and 04h are therefore identical.

The following table shows the format of the master and slave packets. The example shows a master device requesting three register values starting at address 4050h from slave device 11h (17 decimal); the slave device responds with the values 40, 300, and 0 from registers 4050h, 4051h, and 4052h, respectively.

Table B–3: MASTER AND SLAVE DEVICE PACKET TRANSMISSION EXAMPLE

MASTER TRANSMISSION		SLAVE RESPONSE	
PACKET FORMAT	EXAMPLE (HEX)	PACKET FORMAT	EXAMPLE (HEX)
SLAVE ADDRESS	11	SLAVE ADDRESS	11
FUNCTION CODE	04	FUNCTION CODE	04
DATA STARTING ADDRESS - high	40	BYTE COUNT	06
DATA STARTING ADDRESS - low	50	DATA #1 - high	00
NUMBER OF REGISTERS - high	00	DATA #1 - low	28
NUMBER OF REGISTERS - low	03	DATA #2 - high	01
CRC - low	A7	DATA #2 - low	2C
CRC - high	4A	DATA #3 - high	00
		DATA #3 - low	00
		CRC - low	0D
		CRC - high	60

B.2.3 EXECUTE OPERATION (FUNCTION CODE 05H)

This function code allows the master to perform various operations in the relay. Available operations are shown in the *Summary of operation codes* table below.

The following table shows the format of the master and slave packets. The example shows a master device requesting the slave device 11h (17 decimal) to perform a reset. The high and low code value bytes always have the values "FF" and "00" respectively and are a remnant of the original Modbus definition of this function code.

Table B–4: MASTER AND SLAVE DEVICE PACKET TRANSMISSION EXAMPLE

MASTER TRANSMISSION		SLAVE RESPONSE	
PACKET FORMAT	**EXAMPLE (HEX)**	**PACKET FORMAT**	**EXAMPLE (HEX)**
SLAVE ADDRESS	11	SLAVE ADDRESS	11
FUNCTION CODE	05	FUNCTION CODE	05
OPERATION CODE - high	00	OPERATION CODE - high	00
OPERATION CODE - low	01	OPERATION CODE - low	01
CODE VALUE - high	FF	CODE VALUE - high	FF
CODE VALUE - low	00	CODE VALUE - low	00
CRC - low	DF	CRC - low	DF
CRC - high	6A	CRC - high	6A

Table B–5: SUMMARY OF OPERATION CODES FOR FUNCTION 05H

OPERATION CODE (HEX)	DEFINITION	DESCRIPTION
0000	NO OPERATION	Does not do anything.
0001	RESET	Performs the same function as the faceplate RESET key.
0005	CLEAR EVENT RECORDS	Performs the same function as the faceplate **CLEAR EVENT RECORDS** menu command.
0006	CLEAR OSCILLOGRAPHY	Clears all oscillography records.
1000 to 103F	VIRTUAL IN 1 to 64 ON/OFF	Sets the states of Virtual Inputs 1 to 64 either "ON" or "OFF".

B.2.4 STORE SINGLE SETTING (FUNCTION CODE 06H)

This function code allows the master to modify the contents of a single setting register in an relay. Setting registers are always 16 bit (two byte) values transmitted high order byte first. The following table shows the format of the master and slave packets. The example shows a master device storing the value 200 at memory map address 4051h to slave device 11h (17 dec).

Table B–6: MASTER AND SLAVE DEVICE PACKET TRANSMISSION EXAMPLE

MASTER TRANSMISSION		SLAVE RESPONSE	
PACKET FORMAT	**EXAMPLE (HEX)**	**PACKET FORMAT**	**EXAMPLE (HEX)**
SLAVE ADDRESS	11	SLAVE ADDRESS	11
FUNCTION CODE	06	FUNCTION CODE	06
DATA STARTING ADDRESS - high	40	DATA STARTING ADDRESS - high	40
DATA STARTING ADDRESS - low	51	DATA STARTING ADDRESS - low	51
DATA - high	00	DATA - high	00
DATA - low	C8	DATA - low	C8
CRC - low	CE	CRC - low	CE
CRC - high	DD	CRC - high	DD

B

This function code allows the master to modify the contents of a one or more consecutive setting registers in a relay. Setting registers are 16-bit (two byte) values transmitted high order byte first. The maximum number of setting registers that can be stored in a single packet is 60. The following table shows the format of the master and slave packets. The example shows a master device storing the value 200 at memory map address 4051h, and the value 1 at memory map address 4052h to slave device 11h (17 decimal).

Table B–7: MASTER AND SLAVE DEVICE PACKET TRANSMISSION EXAMPLE

MASTER TRANSMISSION		SLAVE RESPONSE	
PACKET FORMAT	**EXAMPLE (HEX)**	**PACKET FORMAT**	**EXMAPLE (HEX)**
SLAVE ADDRESS	11	SLAVE ADDRESS	11
FUNCTION CODE	10	FUNCTION CODE	10
DATA STARTING ADDRESS - hi	40	DATA STARTING ADDRESS - hi	40
DATA STARTING ADDRESS - lo	51	DATA STARTING ADDRESS - lo	51
NUMBER OF SETTINGS - hi	00	NUMBER OF SETTINGS - hi	00
NUMBER OF SETTINGS - lo	02	NUMBER OF SETTINGS - lo	02
BYTE COUNT	04	CRC - lo	07
DATA #1 - high order byte	00	CRC - hi	64
DATA #1 - low order byte	C8		
DATA #2 - high order byte	00		
DATA #2 - low order byte	01		
CRC - low order byte	12		
CRC - high order byte	62		

Programming or operation errors usually happen because of illegal data in a packet. These errors result in an exception response from the slave. The slave detecting one of these errors sends a response packet to the master with the high order bit of the function code set to 1.

The following table shows the format of the master and slave packets. The example shows a master device sending the unsupported function code 39h to slave device 11.

Table B–8: MASTER AND SLAVE DEVICE PACKET TRANSMISSION EXAMPLE

MASTER TRANSMISSION		SLAVE RESPONSE	
PACKET FORMAT	**EXAMPLE (HEX)**	**PACKET FORMAT**	**EXAMPLE (HEX)**
SLAVE ADDRESS	11	SLAVE ADDRESS	11
FUNCTION CODE	39	FUNCTION CODE	B9
CRC - low order byte	CD	ERROR CODE	01
CRC - high order byte	F2	CRC - low order byte	93
		CRC - high order byte	95

B

a) DESCRIPTION

The UR relay has a generic file transfer facility, meaning that you use the same method to obtain all of the different types of files from the unit. The Modbus registers that implement file transfer are found in the "Modbus File Transfer (Read/Write)" and "Modbus File Transfer (Read Only)" modules, starting at address 3100 in the Modbus Memory Map. To read a file from the UR relay, use the following steps:

1. Write the filename to the "Name of file to read" register using a write multiple registers command. If the name is shorter than 80 characters, you may write only enough registers to include all the text of the filename. Filenames are not case sensitive.

2. Repeatedly read all the registers in "Modbus File Transfer (Read Only)" using a read multiple registers command. It is not necessary to read the entire data block, since the UR relay will remember which was the last register you read. The "position" register is initially zero and thereafter indicates how many bytes (2 times the number of registers) you have read so far. The "size of..." register indicates the number of bytes of data remaining to read, to a maximum of 244.

3. Keep reading until the "size of..." register is smaller than the number of bytes you are transferring. This condition indicates end of file. Discard any bytes you have read beyond the indicated block size.

4. If you need to re-try a block, read only the "size of.." and "block of data", without reading the position. The file pointer is only incremented when you read the position register, so the same data block will be returned as was read in the previous operation. On the next read, check to see if the position is where you expect it to be, and discard the previous block if it is not (this condition would indicate that the UR relay did not process your original read request).

The UR relay retains connection-specific file transfer information, so files may be read simultaneously on multiple Modbus connections.

b) OTHER PROTOCOLS

All the files available via Modbus may also be retrieved using the standard file transfer mechanisms in other protocols (for example, TFTP or MMS).

c) COMTRADE, OSCILLOGRAPHY, AND DATA LOGGER FILES

Oscillography and data logger files are formatted using the COMTRADE file format per IEEE PC37.111 Draft 7c (02 September 1997). The files may be obtained in either text or binary COMTRADE format.

d) READING OSCILLOGRAPHY FILES

Familiarity with the oscillography feature is required to understand the following description. Refer to the Oscillography section in Chapter 5 for additional details.

The Oscillography Number of Triggers register is incremented by one every time a new oscillography file is triggered (captured) and cleared to zero when oscillography data is cleared. When a new trigger occurs, the associated oscillography file is assigned a file identifier number equal to the incremented value of this register; the newest file number is equal to the Oscillography_Number_of_Triggers register. This register can be used to determine if any new data has been captured by periodically reading it to see if the value has changed; if the number has increased then new data is available.

The Oscillography Number of Records register specifies the maximum number of files (and the number of cycles of data per file) that can be stored in memory of the relay. The Oscillography Available Records register specifies the actual number of files that are stored and still available to be read out of the relay.

Writing "Yes" (i.e. the value 1) to the Oscillography Clear Data register clears oscillography data files, clears both the Oscillography Number of Triggers and Oscillography Available Records registers to zero, and sets the Oscillography Last Cleared Date to the present date and time.

To read binary COMTRADE oscillography files, read the following filenames:

  `OSCnnnn.CFG` and `OSCnnn.DAT`

Replace "nnn" with the desired oscillography trigger number. For ASCII format, use the following file names

  `OSCAnnnn.CFG` and `OSCAnnn.DAT`

e) READING DATA LOGGER FILES

Familiarity with the data logger feature is required to understand this description. Refer to the Data Logger section of Chapter 5 for details. To read the entire data logger in binary COMTRADE format, read the following files.

    `datalog.cfg` and `datalog.dat`

To read the entire data logger in ASCII COMTRADE format, read the following files.

    `dataloga.cfg` and `dataloga.dat`

To limit the range of records to be returned in the COMTRADE files, append the following to the filename before writing it:

- To read from a specific time to the end of the log: <space> startTime

- To read a specific range of records: <space> startTime <space> endTime

- Replace <startTime> and <endTime> with Julian dates (seconds since Jan. 1 1970) as numeric text.

f) READING EVENT RECORDER FILES

To read the entire event recorder contents in ASCII format (the only available format), use the following filename:

    `EVT.TXT`

To read from a specific record to the end of the log, use the following filename:

    `EVTnnn.TXT`   (replace `nnn` with the desired starting record number)

To read from a specific record to another specific record, use the following filename:

    `EVT.TXT xxxxx yyyyy` (replace `xxxxx` with the starting record number and `yyyyy` with the ending record number)

B.3.2 MODBUS PASSWORD OPERATION

The C60 supports password entry from a local or remote connection.

Local access is defined as any access to settings or commands via the faceplate interface. This includes both keypad entry and the faceplate RS232 connection. Remote access is defined as any access to settings or commands via any rear communications port. This includes both Ethernet and RS485 connections. Any changes to the local or remote passwords enables this functionality.

When entering a settings or command password via EnerVista or any serial interface, the user must enter the corresponding connection password. If the connection is to the back of the C60, the remote password must be used. If the connection is to the RS232 port of the faceplate, the local password must be used.

The command password is set up at memory location 4000. Storing a value of "0" removes command password protection. When reading the password setting, the encrypted value (zero if no password is set) is returned. Command security is required to change the command password. Similarly, the setting password is set up at memory location 4002. These are the same settings and encrypted values found in the **SETTINGS ⇨ PRODUCT SETUP ⇨ PASSWORD SECURITY** menu via the keypad. Enabling password security for the faceplate display will also enable it for Modbus, and *vice-versa*.

To gain command level security access, the command password must be entered at memory location 4008. To gain setting level security access, the setting password must be entered at memory location 400A. The entered setting password must match the current setting password setting, or must be zero, to change settings or download firmware.

Command and setting passwords each have a 30 minute timer. Each timer starts when you enter the particular password, and is re-started whenever you *use* it. For example, writing a setting re-starts the setting password timer and writing a command register or forcing a coil re-starts the command password timer. The value read at memory location 4010 can be used to confirm whether a command password is enabled or disabled (a value of 0 represents disabled). The value read at memory location 4011 can be used to confirm whether a setting password is enabled or disabled.

Command or setting password security access is restricted to the particular port or particular TCP/IP connection on which the entry was made. Passwords must be entered when accessing the relay through other ports or connections, and the passwords must be re-entered after disconnecting and re-connecting on TCP/IP.

B

Table B–9: MODBUS MEMORY MAP (Sheet 1 of 48)

ADDR	REGISTER NAME	RANGE	UNITS	STEP	FORMAT	DEFAULT
Product Information (Read Only)						
0000	UR Product Type	0 to 65535	---	1	F001	0
0002	Product Version	0 to 655.35	---	0.01	F001	1
Product Information (Read Only -- Written by Factory)						
0010	Serial Number	---	---	---	F203	"0"
0020	Manufacturing Date	0 to 4294967295	---	1	F050	0
0022	Modification Number	0 to 65535	---	1	F001	0
0040	Order Code	---	---	---	F204	"Order Code x"

B

F001
UR_UINT16 UNSIGNED 16 BIT INTEGER

F002
UR_SINT16 SIGNED 16 BIT INTEGER

F003
UR_UINT32 UNSIGNED 32 BIT INTEGER (2 registers)

High order word is stored in the first register.
Low order word is stored in the second register.

F004
UR_SINT32 SIGNED 32 BIT INTEGER (2 registers)

High order word is stored in the first register/
Low order word is stored in the second register.

F005
UR_UINT8 UNSIGNED 8 BIT INTEGER

F006
UR_SINT8 SIGNED 8 BIT INTEGER

F011
UR_UINT16 FLEXCURVE DATA (120 points)

A FlexCurve is an array of 120 consecutive data points (x, y) which are interpolated to generate a smooth curve. The y-axis is the user defined trip or operation time setting; the x-axis is the pickup ratio and is pre-defined. Refer to format F119 for a listing of the pickup ratios; the enumeration value for the pickup ratio indicates the offset into the FlexCurve base address where the corresponding time value is stored.

F012
DISPLAY_SCALE DISPLAY SCALING
(unsigned 16-bit integer)

MSB indicates the SI units as a power of ten. LSB indicates the number of decimal points to display.

Example: Current values are stored as 32 bit numbers with three decimal places and base units in Amps. If the retrieved value is 12345.678 A and the display scale equals 0x0302 then the displayed value on the unit is 12.35 kA.

F013
POWER_FACTOR (SIGNED 16 BIT INTEGER)

Positive values indicate lagging power factor; negative values indicate leading.

F040
UR_UINT48 48-BIT UNSIGNED INTEGER

F050
UR_UINT32 TIME and DATE (UNSIGNED 32 BIT INTEGER)

Gives the current time in seconds elapsed since 00:00:00 January 1, 1970.

F051
UR_UINT32 DATE in SR format (alternate format for F050)

First 16 bits are Month/Day (MM/DD/xxxx). Month: 1=January, 2=February,...,12=December; Day: 1 to 31 in steps of 1
Last 16 bits are Year (xx/xx/YYYY): 1970 to 2106 in steps of 1

F052
UR_UINT32 TIME in SR format (alternate format for F050)

First 16 bits are Hours/Minutes (HH:MM:xx.xxx).
Hours: 0=12am, 1=1am,...,12=12pm,...23=11pm;
Minutes: 0 to 59 in steps of 1

Last 16 bits are Seconds (xx:xx:.SS.SSS): 0=00.000s, 1=00.001,...,59999=59.999s)

F060
FLOATING_POINT IEEE FLOATING POINT (32 bits)

F070

UR_UINT16: FLEXLOGIC™ BASE TYPE (6-bit type)

The FlexLogic™ BASE type is 6 bits and is combined with a 9 bit descriptor and 1 bit for protection element to form a 16 bit value. The combined bits are of the form: PTTTTTTDDDDDDDDD, where P bit if set, indicates that the FlexLogic™ type is associated with a protection element state and T represents bits for the BASE type, and D represents bits for the descriptor.

The values in square brackets indicate the base type with P prefix [PTTTTTT] and the values in round brackets indicate the descriptor range.

[0] Off(0) – this is boolean FALSE value
[0] On (1) – this is boolean TRUE value
[2] CONTACT INPUTS (1 to 96)
[3] CONTACT INPUTS OFF (1 to 96)
[4] VIRTUAL INPUTS (1 to 64)
[6] VIRTUAL OUTPUTS (1 to 96)

ENUMERATION: ANALOG INPUT MODE

0 = Default Value, 1 = Last Known

F500
UR_UINT16: PACKED BITFIELD

First register indicates input/output state with bits 0 (MSB) to 15 (LSB) corresponding to input/output state 1 to 16. The second register indicates input/output state with bits 0 to 15 corresponding to input/output state 17 to 32 (if required) The third register indicates input/output state with bits 0 to 15 corresponding to input/output state 33 to 48 (if required). The fourth register indicates input/output state with bits 0 to 15 corresponding to input/output state 49 to 64 (if required).

The number of registers required is determined by the specific data item. A bit value of 0 = Off and 1 = On.

F501
UR_UINT16: LED STATUS

Low byte of register indicates LED status with bit 0 representing the top LED and bit 7 the bottom LED. A bit value of 1 indicates the LED is on, 0 indicates the LED is off.

F502
BITFIELD: ELEMENT OPERATE STATES

Each bit contains the operate state for an element. See the F124 format code for a list of element IDs. The operate bit for element ID X is bit [X mod 16] in register [X/16].

F504
BITFIELD: 3-PHASE ELEMENT STATE

bitmask	element state
0	Pickup
1	Operate
2	Pickup Phase A
3	Pickup Phase B
4	Pickup Phase C

UR_UINT16: FLEXANALOG PARAMETER

Corresponds to the modbus address of the value used when this parameter is selected. Only certain values may be used as Flex-Analogs (basically all metering quantities used in protection).

The IEC 61850 standard is the result of electric utilities and vendors of electronic equipment to produce standardized communications systems. IEC 61850 is a series of standards describing client/server and peer-to-peer communications, substation design and configuration, testing, environmental and project standards. The complete set includes:

- IEC 61850-1: Introduction and overview

- IEC 61850-2: Glossary

- IEC 61850-3: General requirements

- IEC 61850-4: System and project management

- IEC 61850-5: Communications and requirements for functions and device models

- IEC 61850-6: Configuration description language for communication in electrical substations related to IEDs

- IEC 61850-7-1: Basic communication structure for substation and feeder equipment - Principles and models

- IEC 61850-7-2: Basic communication structure for substation and feeder equipment - Abstract communication service interface (ACSI)

- IEC 61850-7-3: Basic communication structure for substation and feeder equipment – Common data classes

- IEC 61850-7-4: Basic communication structure for substation and feeder equipment – Compatible logical node classes and data classes

- IEC 61850-8-1: Specific Communication Service Mapping (SCSM) – Mappings to MMS (ISO 9506-1 and ISO 9506-2) and to ISO/IEC 8802-3

- IEC 61850-9-1: Specific Communication Service Mapping (SCSM) – Sampled values over serial unidirectional multi-drop point to point link

- IEC 61850-9-2: Specific Communication Service Mapping (SCSM) – Sampled values over ISO/IEC 8802-3

- IEC 61850-10: Conformance testing

These documents can be obtained from the IEC (http://www.iec.ch). It is strongly recommended that all those involved with any IEC 61850 implementation obtain this document set.

IEC 61850 specifies the use of the Manufacturing Message Specification (MMS) at the upper (application) layer for transfer of real-time data. This protocol has been in existence for several of years and provides a set of services suitable for the transfer of data within a substation LAN environment. Actual MMS protocol services are mapped to IEC 61850 abstract services in IEC 61850-8-1.

The C60 relay supports IEC 61850 server services over both TCP/IP and TP4/CLNP (OSI) communication protocol stacks. The TP4/CLNP profile requires the C60 to have a network address or Network Service Access Point (NSAP) to establish a communication link. The TCP/IP profile requires the C60 to have an IP address to establish communications. These addresses are located in the **SETTINGS ⇨ PRODUCT SETUP ⇨⇩ COMMUNICATIONS ⇨⇩ NETWORK** menu. Note that the C60 supports IEC 61850 over the TP4/CLNP or TCP/IP stacks, and also operation over both stacks simultaneously. It is possible to have up to five simultaneous connections (in addition to DNP and Modbus/TCP (non-IEC 61850) connections).

- **Client/server**: This is a connection-oriented type of communication. The connection is initiated by the client, and communication activity is controlled by the client. IEC 61850 clients are often substation computers running HMI programs or SOE logging software. Servers are usually substation equipment such as protection relays, meters, RTUs, transformer tap changers, or bay controllers.

- **Peer-to-peer**: This is a non-connection-oriented, high speed type of communication usually between substation equipment such as protection relays. GSSE and GOOSE are methods of peer-to-peer communication.

- **Substation configuration language (SCL)**: A substation configuration language is a number of files used to describe the configuration of substation equipment. Each configured device has an *IEC Capability Description* (ICD) file. The substation single line information is stored in a *System Specification Description* (SSD) file. The entire substation configuration is stored in a *Substation Configuration Description* (SCD) file. The SCD file is the combination of the individual ICD files and the SSD file.

IEC 61850 defines an object-oriented approach to data and services. An IEC 61850 *physical device* can contain one or more *logical device(s)*. Each logical device can contain many *logical nodes*. Each logical node can contain many *data objects*. Each data object is composed of *data attributes* and *data attribute components*. Services are available at each level for performing various functions, such as reading, writing, control commands, and reporting.

Each C60 IED represents one IEC 61850 physical device. The physical device contains one logical device, and the logical device contains many logical nodes. The logical node LPHD1 contains information about the C60 IED physical device. The logical node LLN0 contains information about the C60 IED logical device.

C

The GGIO1 logical node is available in the C60 to provide access to as many 128 digital status points and associated time-stamps and quality flags. The data content must be configured before the data can be used. GGIO1 provides digital status points for access by clients.

It is intended that clients use GGIO1 in order to access digital status values from the C60. Configuration settings are provided to allow the selection of the number of digital status indications available in GGIO1 (8 to 128), and to allow the choice of the C60 FlexLogic™ operands that drive the status of the GGIO1 status indications. Clients can utilize the IEC 61850 buffered and unbuffered reporting features available from GGIO1 in order to build sequence of events (SOE) logs and HMI display screens. Buffered reporting should generally be used for SOE logs since the buffering capability reduces the chances of missing data state changes. Unbuffered reporting should generally be used for local status display.

The GGIO2 logical node is available to provide access to the C60 virtual inputs. Virtual inputs are single-point control (binary) values that can be written by clients. They are generally used as control inputs. GGIO2 provides access to the virtual inputs through the IEC 61850 standard control model (ctlModel) services:

- Status only
- Direct control with normal security
- SBO control with normal security

Configuration settings are available to select the control model for each point. Each virtual input used through GGIO2 should have its **VIRTUAL INPUT 1(64) FUNCTION** setting programmed as "Enabled" and its corresponding **GGIO2 CF SPSCO1(64) CTLMODEL** setting programmed to the appropriate control configuration.

The GGIO3 logical node is available to provide access for clients to values received via configurable GOOSE messages. The values of the digital status indications and analog values in GGIO3 originate in GOOSE messages sent from other devices.

The GGIO4 logical node provides access to as many as 32 analog value points, as well as associated timestamps and quality flags. The data content must be configured before the data can be used. GGIO4 provides analog values for access by clients.

It is intended that clients use GGIO4 to access generic analog values from the C60. Configuration settings allow the selection of the number of analog values available in GGIO4 (4 to 32) and the choice of the FlexAnalog™ values that determine the value of the GGIO4 analog inputs. Clients can utilize polling or the IEC 61850 unbuffered reporting feature available from GGIO4 in order to obtain the analog values provided by GGIO4.

A limited number of measured analog values are available through the MMXU logical nodes.

Each MMXU logical node provides data from a C60 current and voltage source. There is one MMXU available for each configurable source (programmed in the **SETTINGS** ⇨⇩ **SYSTEM SETUP** ⇨⇩ **SIGNAL SOURCES** menu). MMXU1 provides data from C60 source 1, and MMXU2 provides data from C60 source 2.

MMXU data is provided in two forms: instantaneous and deadband. The instantaneous values are updated every time a read operation is performed by a client. The deadband values are calculated as described in IEC 61850 parts 7-1 and 7-3. The selection of appropriate deadband settings for the C60 is described in chapter 5 of this manual.

IEC 61850 buffered and unbuffered reporting capability is available in all MMXU logical nodes. MMXUx logical nodes provide the following data for each source:

*   MMXU1.MX.TotW: three-phase real power
*   MMXU1.MX.TotVAr: three-phase reactive power
*   MMXU1.MX.TotVA: three-phase apparent power
*   MMXU1.MX.TotPF: three-phase power factor
*   MMXU1.MX.Hz: frequency
*   MMXU1.MX.PPV.phsAB: phase AB voltage magnitude and angle
*   MMXU1.MX.PPV.phsBC: phase BC voltage magnitude and angle
*   MMXU1.MX.PPV.phsCA: Phase CA voltage magnitude and angle
*   MMXU1.MX.PhV.phsA: phase AG voltage magnitude and angle
*   MMXU1.MX.PhV.phsB: phase BG voltage magnitude and angle
*   MMXU1.MX.PhV.phsC: phase CG voltage magnitude and angle
*   MMXU1.MX.A.phsA: phase A current magnitude and angle
*   MMXU1.MX.A.phsB: phase B current magnitude and angle
*   MMXU1.MX.A.phsC: phase C current magnitude and angle
*   MMXU1.MX.A.neut: ground current magnitude and angle
*   MMXU1.MX.W.phsA: phase A real power
*   MMXU1.MX.W.phsB: phase B real power
*   MMXU1.MX.W.phsC: phase C real power
*   MMXU1.MX.VAr.phsA: phase A reactive power
*   MMXU1.MX.VAr.phsB: phase B reactive power
*   MMXU1.MX.VAr.phsC: phase C reactive power
*   MMXU1.MX.VA.phsA: phase A apparent power
*   MMXU1.MX.VA.phsB: phase B apparent power
*   MMXU1.MX.VA.phsC: phase C apparent power
*   MMXU1.MX.PF.phsA: phase A power factor
*   MMXU1.MX.PF.phsB: phase B power factor
*   MMXU1.MX.PF.phsC: phase C power factor

The following list describes the protection elements for all UR-series relays. The C60 relay will contain a subset of protection elements from this list.

*   PDIF: bus differential, transformer instantaneous differential, transformer percent differential

C

- PDIS: phase distance, ground distance

- PIOC: phase instantaneous overcurrent, neutral instantaneous overcurrent, ground instantaneous overcurrent, negative-sequence instantaneous overcurrent.

- PTOC: phase time overcurrent, neutral time overcurrent, ground time overcurrent, negative-sequence time overcurrent, neutral directional overcurrent, negative-sequence directional overcurrent

- PTUV: phase undervoltage, auxiliary undervoltage, third harmonic neutral undervoltage

- PTOV: phase overvoltage, neutral overvoltage, auxiliary overvoltage, negative sequence overvoltage

- RBRF: breaker failure

- RREC: autoreclosure

- RPSB: power swing detection

- RFLO: fault locator

- XCBR: breaker control

The protection elements listed above contain *start* (pickup) and *operate* flags. For example, the start flag for PIOC1 is PIOC1.ST.Str.general. The operate flag for PIOC1 is PIOC1.ST.Op.general. For the C60 protection elements, these flags take their values from the pickup and operate FlexLogic™ operands for the corresponding element.

Some protection elements listed above contain directional start values. For example, the directional start value for PDIS1 is PDIS1.ST.Str.dirGeneral. This value is built from the directional FlexLogic™ operands for the element.

The RFLO logical node contains the measurement of the distance to fault calculation in kilometers. This value originates in the fault locator function.

The XCBR logical node is directly associated with the breaker control feature.

- XCBR1.ST.Loc: This is the state of the XCBR1 local/remote switch. A setting is provided to assign a FlexLogic™ operand to determine the state. When local mode is true, IEC 61850 client commands will be rejected.

- XCBR1.ST.Opcnt: This is an operation counter as defined in IEC 61850. Command settings are provided to allow the counter to be cleared.

- XCBR1.ST.Pos: This is the position of the breaker. The breaker control FlexLogic™ operands are used to determine this state. If the breaker control logic indicates that the breaker, or any single pole of the breaker, is closed, then the breaker position state is "on". If the breaker control logic indicates that the breaker is open, then the breaker position state is "off".

- XCBR1.ST.BlkOpn: This is the state of the block open command logic. When true, breaker open commands from IEC 61850 clients will be rejected.

- XCBR1.ST.BlkCls: This is the state of the block close command logic. When true, breaker close commands from IEC 61850 clients will be rejected.

- XCBR1.CO.Pos: This is where IEC 61850 clients can issue open or close commands to the breaker. SBO control with normal security is the only supported IEC 61850 control model.

- XCBR1.CO.BlkOpn: This is where IEC 61850 clients can issue block open commands to the breaker. Direct control with normal security is the only supported IEC 61850 control model.

- XCBR1.CO.BlkCls: This is where IEC 61850 clients can issue block close commands to the breaker. Direct control with normal security is the only supported IEC 61850 control model.

IEC 61850 buffered and unbuffered reporting is provided in the GGIO1 logical nodes (for binary status values) and MMXU1 to MMXU6 (for analog measured values). Report settings can be configured using the EnerVista UR Setup software, sub-station configurator software, or via an IEC 61850 client. The following items can be configured:

- **TrgOps**: Trigger options. The following bits are supported by the C60:
    - Bit 1: data-change
    - Bit 4: integrity
    - Bit 5: general interrogation
- **OptFlds**: Option Fields. The following bits are supported by the C60:
    - Bit 1: sequence-number
    - Bit 2: report-time-stamp
    - Bit 3: reason-for-inclusion
    - Bit 4: data-set-name
    - Bit 5: data-reference
    - Bit 6: buffer-overflow (for buffered reports only)
    - Bit 7: entryID (for buffered reports only)
    - Bit 8: conf-revision
    - Bit 9: segmentation
- **IntgPd**: Integrity period.
- **BufTm**: Buffer time.

MMS file services are supported to allow transfer of oscillography, event record, or other files from a C60 relay.

The timestamp values associated with all IEC 61850 data items represent the *time of the last change* of either the value or quality flags of the data item. To accomplish this functionality, all IEC 61850 data items must be regularly scanned for data changes, and the timestamp updated when a change is detected, regardless of the connection status of any IEC 61850 clients. For applications where there is no IEC 61850 client in use, the IEC 61850 **SERVER SCANNING** setting can be programmed as "Disabled". If a client is in use, this setting should be programmed as "Enabled" to ensure the proper generation of IEC 61850 timestamps.

The logical device name is used to identify the IEC 61850 logical device that exists within the C60. This name is composed of two parts: the IED name setting and the logical device instance. The complete logical device name is the combination of the two character strings programmed in the **IEDNAME** and **LD INST** settings. The default values for these strings are "IED-Name" and "LDInst". These values should be changed to reflect a logical naming convention for all IEC 61850 logical devices in the system.

The LPHD1 logical node contains a data attribute called *location* (LPHD1.DC.PhyNam.location). This is a character string meant to describe the physical location of the C60. This attribute is programmed through the **LOCATION** setting and its default value is "Location". This value should be changed to describe the actual physical location of the C60.

IEC 61850 specifies that each logical node can have a name with a total length of 11 characters. The name is composed of:

- a five or six-character name prefix.

- a four-character standard name (for example, MMXU, GGIO, PIOC, etc.).

- a one or two-character instantiation index.

Complete names are of the form `xxxxxxPIOC1`, where the `xxxxxx` character string is configurable. Details regarding the logical node naming rules are given in IEC 61850 parts 6 and 7-2. It is recommended that a consistent naming convention be used for an entire substation project.

A built-in TCP/IP connection timeout of two minutes is employed by the C60 to detect 'dead' connections. If there is no data traffic on a TCP connection for greater than two minutes, the connection will be aborted by the C60. This frees up the connection to be used by other clients. Therefore, when using IEC 61850 reporting, clients should configure report control block items such that an integrity report will be issued at least every 2 minutes (120000 ms). This ensures that the C60 will not abort the connection. If other MMS data is being polled on the same connection at least once every 2 minutes, this timeout will not apply.

The C60 relay makes available a number of non-IEC 61850 data items. These data items can be accessed through the "UR" MMS domain. IEC 61850 data can be accessed through the standard IEC 61850 logical device. To access the non-IEC data items, the **INCLUDE NON-IEC DATA** setting must be "Enabled".

The exact structure and values of the supported IEC 61850 logical nodes can be seen by connecting to a C60 relay with an MMS browser, such as the "MMS Object Explorer and AXS4-MMS" DDE/OPC server from Sisco Inc.

IEC 61850 specifies two types of peer-to-peer data transfer services: Generic Substation State Events (GSSE) and Generic Object Oriented Substation Events (GOOSE). GSSE services are compatible with UCA 2.0 GOOSE. IEC 61850 GOOSE services provide virtual LAN (VLAN) support, Ethernet priority tagging, and Ethertype Application ID configuration. The support for VLANs and priority tagging allows for the optimization of Ethernet network traffic. GOOSE messages can be given a higher priority than standard Ethernet traffic, and they can be separated onto specific VLANs. Because of the additional features of GOOSE services versus GSSE services, it is recommended that GOOSE be used wherever backwards compatibility with GSSE (or UCA 2.0 GOOSE) is not required.

Devices that transmit GSSE and/or GOOSE messages also function as servers. Each GSSE publisher contains a "GSSE control block" to configure and control the transmission. Each GOOSE publisher contains a "GOOSE control block" to configure and control the transmission. The transmission is also controlled via device settings. These settings can be seen in the ICD and/or SCD files, or in the device configuration software or files.

IEC 61850 recommends a default priority value of 4 for GOOSE. Ethernet traffic that does not contain a priority tag has a default priority of 1. More details are specified in IEC 61850 part 8-1.

IEC 61850 recommends that the Ethertype Application ID number be configured according to the GOOSE source. In the C60, the transmitted GOOSE Application ID number must match the configured receive Application ID number in the receiver. A common number may be used for all GOOSE transmitters in a system. More details are specified in IEC 61850 part 8-1.

IEC 61850 Generic Substation Status Event (GSSE) communication is compatible with UCA GOOSE communication. GSSE messages contain a number of double point status data items. These items are transmitted in two pre-defined data structures named DNA and UserSt. Each DNA and UserSt item is referred to as a 'bit pair'. GSSE messages are transmitted in response to state changes in any of the data points contained in the message. GSSE messages always contain the same number of DNA and UserSt bit pairs. Depending the on the configuration, only some of these bit pairs may have values that are of interest to receiving devices.

The **GSSE FUNCTION**, **GSSE ID**, and **GSSE DESTINATION MAC ADDRESS** settings are used to configure GSSE transmission. **GSSE FUNCTION** is set to "Enabled" to enable the transmission. If a valid multicast Ethernet MAC address is entered for the **GSSE DESTINATION MAC ADDRESS** setting, this address will be used as the destination MAC address for GSSE messages. If a valid multicast Ethernet MAC address is not entered (for example, 00 00 00 00 00 00), the C60 will use the source Ethernet MAC address as the destination, with the multicast bit set.

The C60 supports two types of IEC 61850 Generic Object Oriented Substation Event (GOOSE) communication: fixed GOOSE and configurable GOOSE. All GOOSE messages contain IEC 61850 data collected into a *dataset*. It is this dataset that is transferred using GOOSE message services. The dataset transferred using the C60 fixed GOOSE is the same data that is transferred using the GSSE feature; that is, the DNA and UserSt bit pairs. The FlexLogic™ operands that determine the state of the DNA and UserSt bit pairs are configurable via settings, but the fixed GOOSE dataset always contains the same DNA/UserSt data structure. Upgrading from GSSE to GOOSE services is simply a matter of enabling fixed GOOSE and disabling GSSE. The remote inputs and outputs are configured in the same manner for both GSSE and fixed GOOSE.

It is recommended that the fixed GOOSE be used for implementations that require GOOSE data transfer between UR-series IEDs. Configurable GOOSE may be used for implementations that require GOOSE data transfer between UR-series IEDs and devices from other manufacturers.

The configurable GOOSE feature allows for the configuration of the datasets to be transmitted or received from the C60. The C60 supports the configuration of eight (8) transmission and reception datasets, allowing for the optimization of data transfer between devices.

Items programmed for dataset 1 will have changes in their status transmitted as soon as the change is detected. Dataset 1 should be used for high-speed transmission of data that is required for applications such as transfer tripping, blocking, and breaker fail initiate. At least one digital status value needs to be configured in dataset 1 to enable transmission of all data configured for dataset 1. Configuring analog data only to dataset 1 will not activate transmission.

Items programmed for datasets 2 through 8 will have changes in their status transmitted at a maximum rate of every 100 ms. Datasets 2 through 8 will regularly analyze each data item configured within them every 100 ms to identify if any changes have been made. If any changes in the data items are detected, these changes will be transmitted through a GOOSE message. If there are no changes detected during this 100 ms period, no GOOSE message will be sent.

For all datasets 1 through 8, the integrity GOOSE message will still continue to be sent at the pre-configured rate even if no changes in the data items are detected.

The GOOSE functionality was enhanced to prevent the relay from flooding a communications network with GOOSE messages due to an oscillation being created that is triggering a message.

The C60 has the ability of detecting if a data item in one of the GOOSE datasets is erroneously oscillating. This can be caused by events such as errors in logic programming, inputs improperly being asserted and de-asserted, or failed station components. If erroneously oscillation is detected, the C60 will stop sending GOOSE messages from the dataset for a minimum period of one second. Should the oscillation persist after the one second time-out period, the C60 will continue to block transmission of the dataset. The C60 will assert the **MAINTENANCE ALERT: GGIO Ind XXX oscill** self-test error message on the front panel display, where **XXX** denotes the data item detected as oscillating.

The configurable GOOSE feature is recommended for applications that require GOOSE data transfer between UR-series IEDs and devices from other manufacturers. Fixed GOOSE is recommended for applications that require GOOSE data transfer between UR-series IEDs.

IEC 61850 GOOSE messaging contains a number of configurable parameters, all of which must be correct to achieve the successful transfer of data. It is critical that the configured datasets at the transmission and reception devices are an exact match in terms of data structure, and that the GOOSE addresses and name strings match exactly. Manual configuration is possible, but third-party substation configuration software may be used to automate the process. The EnerVista UR Setup-software can produce IEC 61850 ICD files and import IEC 61850 SCD files produced by a substation configurator (refer to the *IEC 61850 IED configuration* section later in this appendix).

The following example illustrates the configuration required to transfer IEC 61850 data items between two devices. The general steps required for transmission configuration are:

1. Configure the transmission dataset.

2. Configure the GOOSE service settings.

3. Configure the data.

The general steps required for reception configuration are:

1. Configure the reception dataset.

2. Configure the GOOSE service settings.

3. Configure the data.

This example shows how to configure the transmission and reception of three IEC 61850 data items: a single point status value, its associated quality flags, and a floating point analog value.

The following procedure illustrates the transmission configuration.

1. Configure the transmission dataset by making the following changes in the **PRODUCT SETUP** ⇨⇩ **COMMUNICATION** ⇨⇩ **IEC 61850 PROTOCOL** ⇨ **GSSE/GOOSE CONFIGURATION** ⇨ **TRANSMISSION** ⇨⇩ **CONFIGURABLE GOOSE** ⇨ **CONFIGURABLE GOOSE 1** ⇨⇩ **CONFIG GSE 1 DATASET ITEMS** settings menu:

   – Set **ITEM 1** to "GGIO1.ST.Ind1.q" to indicate quality flags for GGIO1 status indication 1.

   – Set **ITEM 2** to "GGIO1.ST.Ind1.stVal" to indicate the status value for GGIO1 status indication 1.

   The transmission dataset now contains a set of quality flags and a single point status Boolean value. The reception dataset on the receiving device must exactly match this structure.

2. Configure the GOOSE service settings by making the following changes in the **PRODUCT SETUP** ⇨⇩ **COMMUNICATION** ⇨⇩ **IEC 61850 PROTOCOL** ⇨ **GSSE/GOOSE CONFIGURATION** ⇨ **TRANSMISSION** ⇨⇩ **CONFIGURABLE GOOSE** ⇨ **CONFIGU-RABLE GOOSE 1** settings menu:

- – Set **CONFIG GSE 1 FUNCTION** to "Enabled".

- – Set **CONFIG GSE 1 ID** to an appropriate descriptive string (the default value is "GOOSEOut_1").

- – Set **CONFIG GSE 1 DST MAC** to a multicast address (for example, 01 00 00 12 34 56).

- – Set the **CONFIG GSE 1 VLAN PRIORITY**; the default value of "4" is OK for this example.

- – Set the **CONFIG GSE 1 VLAN ID** value; the default value is "0", but some switches may require this value to be "1".

- – Set the **CONFIG GSE 1 ETYPE APPID** value. This setting represents the Ethertype application ID and must match the configuration on the receiver (the default value is "0").

- – Set the **CONFIG GSE 1 CONFREV** value. This value changes automatically as described in IEC 61850 part 7-2. For this example it can be left at its default value.

3. Configure the data by making the following changes in the **PRODUCT SETUP** ⇨⇩ **COMMUNICATION** ⇨⇩ **IEC 61850 PROTO-COL** ⇨ **GGIO1 STATUS CONFIGURATION** settings menu:

- – Set **GGIO1 INDICATION 1** to a FlexLogic™ operand used to provide the status of GGIO1.ST.Ind1.stVal (for example, a contact input, virtual input, a protection element status, etc.).

The C60 must be rebooted (control power removed and re-applied) before these settings take effect.

The following procedure illustrates the reception configuration.

1. Configure the reception dataset by making the following changes in the **PRODUCT SETUP** ⇨⇩ **COMMUNICATION** ⇨⇩ **IEC 61850 PROTOCOL** ⇨ **GSSE/GOOSE CONFIGURATION** ⇨⇩ **RECEPTION** ⇨⇩ **CONFIGURABLE GOOSE** ⇨ **CONFIGURABLE GOOSE 1** ⇨⇩ **CONFIG GSE 1 DATASET ITEMS** settings menu:

- – Set **ITEM 1** to "GGIO3.ST.Ind1.q" to indicate quality flags for GGIO3 status indication 1.

- – Set **ITEM 2** to "GGIO3.ST.Ind1.stVal" to indicate the status value for GGIO3 status indication 1.

The reception dataset now contains a set of quality flags, a single point status Boolean value, and a floating point analog value. This matches the transmission dataset configuration above.

2. Configure the GOOSE service settings by making the following changes in the **INPUTS/OUTPUTS** ⇨⇩ **REMOTE DEVICES** ⇨⇩ **REMOTE DEVICE 1** settings menu:

- – Set **REMOTE DEVICE 1 ID** to match the GOOSE ID string for the transmitting device. Enter "GOOSEOut_1".

- – Set **REMOTE DEVICE 1 ETYPE APPID** to match the Ethertype application ID from the transmitting device. This is "0" in the example above.

- – Set the **REMOTE DEVICE 1 DATASET** value. This value represents the dataset number in use. Since we are using configurable GOOSE 1 in this example, program this value as "GOOSEIn 1".

3. Configure the data by making the following changes in the **INPUTS/OUTPUTS** ⇨⇩ **REMOTE INPUTS** ⇨⇩ **REMOTE INPUT 1** settings menu:

- – Set **REMOTE IN 1 DEVICE** to "GOOSEOut_1".

- – Set **REMOTE IN 1 ITEM** to "Dataset Item 2". This assigns the value of the GGIO3.ST.Ind1.stVal single point status item to remote input 1.

Remote input 1 can now be used in FlexLogic™ equations or other settings. The C60 must be rebooted (control power removed and re-applied) before these settings take effect.

The value of remote input 1 (Boolean on or off) in the receiving device will be determined by the GGIO1.ST.Ind1.stVal value in the sending device. The above settings will be automatically populated by the EnerVista UR Setup software when a complete SCD file is created by third party substation configurator software.

C.4.5 ETHERNET MAC ADDRESS FOR GSSE/GOOSE

Ethernet capable devices each contain a unique identifying address called a Media Access Control (MAC) address. This address cannot be changed and is unique for each Ethernet device produced worldwide. The address is six bytes in length and is usually represented as six hexadecimal values (for example, 00 A0 F4 01 02 03). It is used in all Ethernet frames as the 'source' address of the frame. Each Ethernet frame also contains a *destination* address. The destination address can be different for each Ethernet frame depending on the intended destination of the frame.

A special type of destination address called a *multicast* address is used when the Ethernet frame can be received by more than one device. An Ethernet MAC address is multicast when the least significant bit of the first byte is set (for example, 01 00 00 00 00 00 is a multicast address).

GSSE and GOOSE messages must have multicast destination MAC addresses.

By default, the C60 is configured to use an automated multicast MAC scheme. If the C60 destination MAC address setting is not a valid multicast address (that is, the least significant bit of the first byte is not set), the address used as the destination MAC will be the same as the local MAC address, but with the multicast bit set. Thus, if the local MAC address is 00 A0 F4 01 02 03, then the destination MAC address will be 01 A0 F4 01 02 03.

C.4.6 GSSE ID AND GOOSE ID SETTINGS

C

GSSE messages contain an identifier string used by receiving devices to identify the sender of the message, defined in IEC 61850 part 8-1 as GsID. This is a programmable 65-character string. This string should be chosen to provide a descriptive name of the originator of the GSSE message.

GOOSE messages contain an identifier string used by receiving devices to identify the sender of the message, defined in IEC 61850 part 8-1 as GoID. This programmable 65-character string should be a descriptive name of the originator of the GOOSE message. GOOSE messages also contain two additional character strings used for identification of the message: DatSet - the name of the associated dataset, and GoCBRef - the reference (name) of the associated GOOSE control block. These strings are automatically populated and interpreted by the C60; no settings are required.

The C60 can be configured for IEC 61850 via the EnerVista UR Setup software as follows.

1. An ICD file is generated for the C60 by the EnerVista UR Setup software that describe the capabilities of the IED.

2. The ICD file is then imported into a system configurator along with other ICD files for other IEDs (from GE or other vendors) for system configuration.

3. The result is saved to a SCD file, which is then imported back to EnerVista UR Setup to create one or more settings file(s). The settings file(s) can then be used to update the relay(s) with the new configuration information.

The configuration process is illustrated below.

Figure 0–1: IED CONFIGURATION PROCESS

The following acronyms and abbreviations are used in the procedures describing the IED configuration process for IEC 61850:

• BDA: Basic Data Attribute, that is not structured

• DAI: Instantiated Data Attribute

• DO: Data Object type or instance, depending on the context

- DOI: Instantiated Data Object

- IED: Intelligent Electronic Device

- LDInst: Instantiated Logical Device

- LNInst: Instantiated Logical Node

- SCL: Substation Configuration Description Language. The configuration language is an application of the Extensible Markup Language (XML) version 1.0.

- SDI: Instantiated Sub DATA; middle name part of a structured DATA name

- UR: GE Multilin Universal Relay series

- URI: Universal Resource Identifier

- URS: UR-series relay setting file

- XML: Extensible Markup Language

The following SCL variants are also used:

- ICD: IED Capability Description

- CID: Configured IED Description

- SSD: System Specification Description

- SCD: Substation Configuration Description

The following IEC related tools are referenced in the procedures that describe the IED configuration process for IEC 61850:

- **System configurator** or **Substation configurator**: This is an IED independent system level tool that can import or export configuration files defined by IEC 61850-6. It can import configuration files (ICD) from several IEDs for system level engineering and is used to add system information shared by different IEDs. The system configuration generates a substation related configuration file (SCD) which is fed back to the IED configurator (for example, EnerVista UR Setup) for system related IED configuration. The system configurator should also be able to read a system specification file (SSD) to use as base for starting system engineering, or to compare it with an engineered system for the same substation.

- **IED configurator**: This is a vendor specific tool that can directly or indirectly generate an ICD file from the IED (for example, from a settings file). It can also import a system SCL file (SCD) to set communication configuration parameters (that is, required addresses, reception GOOSE datasets, IDs of incoming GOOSE datasets, etc.) for the IED. The IED configurator functionality is implemented in the GE Multilin EnerVista UR Setup software.

<div align="right">

C.5.2 CONFIGURING IEC 61850 SETTINGS
</div>

Before creating an ICD file, the user can customize the IEC 61850 related settings for the IED. For example, the IED name and logical device instance can be specified to uniquely identify the IED within the substation, or transmission GOOSE datasets created so that the system configurator can configure the cross-communication links to send GOOSE messages from the IED. Once the IEC 61850 settings are configured, the ICD creation process will recognize the changes and generate an ICD file that contains the updated settings.

Some of the IED settings will be modified during they system configuration process. For example, a new IP address may be assigned, line items in a Transmission GOOSE dataset may be added or deleted, or prefixes of some logical nodes may be changed. While all new configurations will be mapped to the C60 settings file when importing an SCD file, all unchanged settings will preserve the same values in the new settings file.

These settings can be configured either directly through the relay panel or through the EnerVista UR Setup software (preferred method). The full list of IEC 61850 related settings for are as follows:

- Network configuration: IP address, IP subnet mask, and default gateway IP address (access through the **Settings > Product Setup > Communications > Network** menu tree in EnerVista UR Setup).

- Server configuration: IED name and logical device instance (access through the **Settings > Product Setup > Communications > IEC 61850 > Server Configuration** menu tree in EnerVista UR Setup).

- Logical node prefixes, which includes prefixes for all logical nodes except LLN0 (access through the **Settings > Product Setup > Communications > IEC 61850 > Logical Node Prefixes** menu tree in EnerVista UR Setup).

- MMXU deadbands, which includes deadbands for all available MMXUs. The number of MMXUs is related to the number of CT/VT modules in the relay. There are two MMXUs for each CT/VT module. For example, if a relay contains two CT/VT modules, there will be four MMXUs available (access through the **Settings > Product Setup > Communications > IEC 61850 > MMXU Deadbands** menu tree in EnerVista UR Setup).

- GGIO1 status configuration, which includes the number of status points in GGIO1 as well as the potential internal mappings for each GGIO1 indication. However only the number of status points will be used in the ICD creation process (access through the **Settings > Product Setup > Communications > IEC 61850 > GGIO1 Status Configuration** menu tree in EnerVista UR Setup).

- GGIO2 control configuration, which includes ctlModels for all SPCSOs within GGIO2 (access through the **Settings > Product Setup > Communications > IEC 61850 > GGIO2 Control Configuration** menu tree in EnerVista UR Setup).

- Configurable transmission GOOSE, which includes eight configurable datasets that can be used for GOOSE transmission. The GOOSE ID can be specified for each dataset (it must be unique within the IED as well as across the whole substation), as well as the destination MAC address, VLAN priority, VLAN ID, ETYPE APPID, and the dataset items. The selection of the dataset item is restricted by firmware version; for version 5.5x, only GGIO1.ST.Indx.stVal and GGIO1.ST.Indx.q are valid selection (where x is between 1 to N, and N is determined by number of GGIO1 status points). Although configurable transmission GOOSE can also be created and altered by some third-party system configurators, we recommend configuring transmission GOOSE for GE Multilin IEDs before creating the ICD, and strictly within EnerVista UR Setup software or the front panel display (access through the **Settings > Product Setup > Communications > IEC 61850 > GSSE/GOOSE Configuration > Transmission > Tx Configurable GOOSE** menu tree in EnerVista UR Setup).

- Configurable reception GOOSE, which includes eight configurable datasets that can be used for GOOSE reception. However, unlike datasets for transmission, datasets for reception only contains dataset items, and they are usually created automatically by process of importing the SCD file (access through the **Settings > Product Setup > Communications > IEC 61850 > GSSE/GOOSE Configuration > Reception > Rx Configurable GOOSE** menu tree in EnerVista UR Setup).

- Remote devices configuration, which includes remote device ID (GOOSE ID or GoID of the incoming transmission GOOSE dataset), ETYPE APPID (of the GSE communication block for the incoming transmission GOOSE), and DATASET (which is the name of the associated reception GOOSE dataset). These settings are usually done automatically by process of importing SCD file (access through the **Settings > Inputs/Outputs > Remote Devices** menu tree in EnerVista UR Setup).

- Remote inputs configuration, which includes device (remote device ID) and item (which dataset item in the associated reception GOOSE dataset to map) values. Only the items with cross-communication link created in SCD file should be mapped. These configurations are usually done automatically by process of importing SCD file (access through the **Settings > Inputs/Outputs > Remote Inputs** menu tree in EnerVista UR Setup).

<div align="right">**C.5.3 ABOUT ICD FILES**</div>

The SCL language is based on XML, and its syntax definition is described as a W3C XML Schema. ICD is one type of SCL file (which also includes SSD, CID and SCD files). The ICD file describes the capabilities of an IED and consists of four major sections:

- Header

- Communication

- IEDs

- DataTypeTemplates

The root file structure of an ICD file is illustrated below.

Figure 0–2: ICD FILE STRUCTURE, SCL (ROOT) NODE

The **Header** node identifies the ICD file and its version, and specifies options for the mapping of names to signals

The **Communication** node describes the direct communication connection possibilities between logical nodes by means of logical buses (sub-networks) and IED access ports. The communication section is structured as follows.

Figure 0–3: ICD FILE STRUCTURE, COMMUNICATIONS NODE

The **SubNetwork** node contains all access points which can (logically) communicate with the sub-network protocol and without the intervening router. The **ConnectedAP** node describes the IED access point connected to this sub-network. The **Address** node contains the address parameters of the access point. The **GSE** node provides the address element for stating the control block related address parameters, where **IdInst** is the instance identification of the logical device within the IED on which the control block is located, and **cbName** is the name of the control block.

The **IED** node describes the (pre-)configuration of an IED: its access points, the logical devices, and logical nodes instantiated on it. Furthermore, it defines the capabilities of an IED in terms of communication services offered and, together with its **LNType**, instantiated data (DO) and its default or configuration values. There should be only one IED section in an ICD since it only describes one IED.

Figure 0–4: ICD FILE STRUCTURE, IED NODE

The **DataTypeTemplates** node defines instantiable logical node types. A logical node type is an instantiable template of the data of a logical node. A **LnodeType** is referenced each time that this instantiable type is needed with an IED. A logical node type template is built from DATA (DO) elements, which again have a DO type, which is derived from the DATA classes (CDC). DOs consist of attributes (DA) or of elements of already defined DO types (SDO). The attribute (DA) has a functional constraint, and can either have a basic type, be an enumeration, or a structure of a **DAType**. The DAType is built from BDA elements, defining the structure elements, which again can be **BDA** elements of have a base type such as DA.

Figure 0–5: ICD FILE STRUCTURE, DATATYPETEMPLATES NODE

An ICD file can be created directly from a connected C60 IED or from an offline C60 settings file with the EnerVista UR Setup software using the following procedure:

1. Right-click the connected UR-series relay or settings file and select **Create ICD File**.

2. The EnerVista UR Setup will prompt to save the file. Select the file path and enter the name for the ICD file, then click **OK** to generate the file.

The time to create an ICD file from the offline C60 settings file is typically much quicker than create an ICD file directly from the relay.

System configuration is performed in the system configurator. While many vendors (including GE Multilin) are working their own system configuration tools, there are some system configurators available in the market (for example, Siemens DIGSI version 4.6 or above and ASE Visual SCL Beta 0.12).

Although the configuration tools vary from one vendor to another, the procedure is pretty much the same. First, a substation project must be created, either as an empty template or with some system information by importing a system specification file (SSD). Then, IEDs are added to the substation. Since each IED is represented by its associated ICD, the ICD files are imported into the substation project, and the system configurator validates the ICD files during the importing process. If the ICD files are successfully imported into the substation project, it may be necessary to perform some additional minor steps to attach the IEDs to the substation (see the system configurator manual for details).

Once all IEDs are inserted into the substation, further configuration is possible, such as:

*   assigning network addresses to individual IEDs
*   customizing the prefixes of logical nodes
*   creating cross-communication links (configuring GOOSE messages to send from one IED to others)

When system configurations are complete, the results are saved to an SCD file, which contains not only the configuration for each IED in the substation, but also the system configuration for the entire substation. Finally, the SCD file is passed back to the IED configurator (vendor specific tool) to update the new configuration into the IED.

The SCD file consists of at least five major sections:

- Header
- Substation
- Communication
- IED section (one or more)
- DataTypeTemplates

The root file structure of an SCD file is illustrated below.

Figure 0–6: SCD FILE STRUCTURE, SCL (ROOT) NODE

Like ICD files, the **Header** node identifies the SCD file and its version, and specifies options for the mapping of names to signals.

The **Substation** node describes the substation parameters:

Figure 0–7: SCD FILE STRUCTURE, SUBSTATION NODE

The **Communication** node describes the direct communication connection possibilities between logical nodes by means of logical buses (sub-networks) and IED access ports. The communication section is structured as follows.

Figure 0–8: SCD FILE STRUCTURE, COMMUNICATIONS NODE

The **SubNetwork** node contains all access points which can (logically) communicate with the sub-network protocol and without the intervening router. The **ConnectedAP** node describes the IED access point connected to this sub-network. The **Address** node contains the address parameters of the access point. The **GSE** node provides the address element for stating the control block related address parameters, where **IdInst** is the instance identification of the logical device within the IED on which the control block is located, and **cbName** is the name of the control block.

The **IED Section** node describes the configuration of an IED.

Figure 0–9: SCD FILE STRUCTURE, IED NODE

C.5.6 IMPORTING AN SCD FILE WITH ENERVISTA UR SETUP

The following procedure describes how to update the C60 with the new configuration from an SCD file with the EnerVista UR Setup software.

1. Right-click anywhere in the files panel and select the **Import Contents From SCD File** item.

2. Select the saved SCD file and click **Open**.

3. The software will open the SCD file and then prompt the user to save a UR-series settings file. Select a location and name for the URS (UR-series relay settings) file.

   If there is more than one GE Multilin IED defined in the SCD file, the software prompt the user to save a UR-series settings file for each IED.

4. After the URS file is created, modify any settings (if required).

5. To update the relay with the new settings, right-click on the settings file in the settings tree and select the **Write Settings File to Device** item.

6. The software will prompt for the target device. Select the target device from the list provided and click **Send**. The new settings will be updated to the selected device.

T1	Time resolution of internal clock (nearest negative power of 2 in seconds)			20
T2	Time accuracy of internal clock			
T3	supported TimeStamp resolution (nearest value of 2^{-n} in seconds, accoridng to 5.5.3.7.3.3)			20

NOTE

c6: shall declare support for at least one (BRCB or URCB)

c7: shall declare support for at least one (QueryLogByTime or QueryLogAfter)

c8: shall declare support for at least one (SendGOOSEMessage or SendGSSEMessage)

c9: shall declare support if TP association is available

c10: shall declare support for at least one (SendMSVMessage or SendUSVMessage)

The UR-series of relays supports IEC 61850 logical nodes as indicated in the following table. Note that the actual instantiation of each logical node is determined by the product order code. For example. the logical node "PDIS" (distance protection) is available only in the D60 Line Distance Relay.

Table 0–1: IEC 61850 LOGICAL NODES (Sheet 1 of 3)

NODES	UR-FAMILY
L: SYSTEM LOGICAL NODES	
LPHD: Physical device information	Yes
LLN0: Logical node zero	Yes
P: LOGICAL NODES FOR PROTECTION FUNCTIONS	
PDIF: Differential	Yes
PDIR: Direction comparison	---
PDIS: Distance	Yes
PDOP: Directional overpower	---
PDUP: Directional underpower	---
PFRC: Rate of change of frequency	---
PHAR: Harmonic restraint	---
PHIZ: Ground detector	---
PIOC: Instantaneous overcurrent	Yes
PMRI Motor restart inhibition	---
PMSS: Motor starting time supervision	---
POPF: Over power factor	---
PPAM: Phase angle measuring	---
PSCH: Protection scheme	---
PSDE: Sensitive directional earth fault	---
PTEF: Transient earth fault	---
PTOC: Time overcurrent	Yes
PTOF: Overfrequency	---
PTOV: Overvoltage	Yes
PTRC: Protection trip conditioning	Yes
PTTR: Thermal overload	Yes
PTUC: Undercurrent	---
PTUV: Undervoltage	Yes
PUPF: Underpower factor	---
PTUF: Underfrequency	---
PVOC: Voltage controlled time overcurrent	---
PVPH: Volts per Hz	---
PZSU: Zero speed or underspeed	---
R: LOGICAL NODES FOR PROTECTION RELATED FUNCTIONS	
RDRE: Disturbance recorder function	---
RADR: Disturbance recorder channel analogue	---
RBDR: Disturbance recorder channel binary	---
RDRS: Disturbance record handling	---
RBRF: Breaker failure	Yes
RDIR: Directional element	---
RFLO: Fault locator	Yes
RPSB: Power swing detection/blocking	Yes
RREC: Autoreclosing	Yes

Table 0–1: IEC 61850 LOGICAL NODES (Sheet 2 of 3)

NODES	UR-FAMILY
RSYN: Synchronism-check or synchronizing	---
C: LOGICAL NODES FOR CONTROL	
CALH: Alarm handling	---
CCGR: Cooling group control	---
CILO: Interlocking	---
CPOW: Point-on-wave switching	---
CSWI: Switch controller	---
G: LOGICAL NODES FOR GENERIC REFERENCES	
GAPC: Generic automatic process control	---
GGIO: Generic process I/O	Yes
GSAL: Generic security application	---
I: LOGICAL NODES FOR INTERFACING AND ARCHIVING	
IARC: Archiving	---
IHMI: Human machine interface	---
ITCI: Telecontrol interface	---
ITMI: Telemonitoring interface	---
A: LOGICAL NODES FOR AUTOMATIC CONTROL	
ANCR: Neutral current regulator	---
ARCO: Reactive power control	---
ATCC: Automatic tap changer controller	---
AVCO: Voltage control	---
M: LOGICAL NODES FOR METERING AND MEASUREMENT	
MDIF: Differential measurements	---
MHAI: Harmonics or interharmonics	---
MHAN: Non phase related harmonics or interharmonic	---
MMTR: Metering	---
MMXN: Non phase related measurement	**Yes**
MMXU: Measurement	**Yes**
MSQI: Sequence and imbalance	---
MSTA: Metering statistics	---
S: LOGICAL NODES FOR SENSORS AND MONITORING	
SARC: Monitoring and diagnostics for arcs	---
SIMG: Insulation medium supervision (gas)	---
SIML: Insulation medium supervision (liquid)	---
SPDC: Monitoring and diagnostics for partial discharges	---
X: LOGICAL NODES FOR SWITCHGEAR	
XCBR: Circuit breaker	**Yes**
XSWI: Circuit switch	---
T: LOGICAL NODES FOR INSTRUMENT TRANSFORMERS	
TCTR: Current transformer	---
TVTR: Voltage transformer	---
Y: LOGICAL NODES FOR POWER TRANSFORMERS	
YEFN: Earth fault neutralizer (Peterson coil)	---
YLTC: Tap changer	---
YPSH: Power shunt	---
YPTR: Power transformer	---

C

Table 0–1: IEC 61850 LOGICAL NODES (Sheet 3 of 3)

NODES	UR-FAMILY
Z: LOGICAL NODES FOR FURTHER POWER SYSTEM EQUIPMENT	
ZAXN: Auxiliary network	---
ZBAT: Battery	---
ZBSH: Bushing	---
ZCAB: Power cable	---
ZCAP: Capacitor bank	---
ZCON: Converter	---
ZGEN: Generator	---
ZGIL: Gas insulated line	---
ZLIN: Power overhead line	---
ZMOT: Motor	---
ZREA: Reactor	---
ZRRC: Rotating reactive component	---
ZSAR: Surge arrestor	---
ZTCF: Thyristor controlled frequency converter	---
ZTRC: Thyristor controlled reactive component	---

C

This document is adapted from the IEC 60870-5-104 standard. For ths section the boxes indicate the following: ⊠ – used in standard direction; ☐ – not used; ■ – cannot be selected in IEC 60870-5-104 standard.

1. **SYSTEM OR DEVICE:**

    ☐ System Definition

    ☐ Controlling Station Definition (Master)

    ⊠ **Controlled Station Definition (Slave)**

2. **NETWORK CONFIGURATION:**

    ■ ~~Point-to-Point~~   ■ ~~Multipoint~~

    ■ ~~Multiple Point-to-Point~~   ■ ~~Multipoint Star~~

3. **PHYSICAL LAYER**

    Transmission Speed (control direction):

Unbalanced Interchange Circuit V.24/V.28 Standard:	Unbalanced Interchange Circuit V.24/V.28 Recommended if >1200 bits/s:	Balanced Interchange Circuit X.24/X.27:
■ ~~100 bits/sec.~~ ■ ~~200 bits/sec.~~ ■ ~~300 bits/sec.~~ ■ ~~600 bits/sec.~~ ■ ~~1200 bits/sec.~~	■ ~~2400 bits/sec.~~ ■ ~~4800 bits/sec.~~ ■ ~~9600 bits/sec.~~	■ ~~2400 bits/sec.~~ ■ ~~4800 bits/sec.~~ ■ ~~9600 bits/sec.~~ ■ ~~19200 bits/sec.~~ ■ ~~38400 bits/sec.~~ ■ ~~56000 bits/sec.~~ ■ ~~64000 bits/sec.~~

Transmission Speed (monitor direction):

Unbalanced Interchange Circuit V.24/V.28 Standard:	Unbalanced Interchange Circuit V.24/V.28 Recommended if >1200 bits/s:	Balanced Interchange Circuit X.24/X.27:
■ ~~100 bits/sec.~~ ■ ~~200 bits/sec.~~ ■ ~~300 bits/sec.~~ ■ ~~600 bits/sec.~~ ■ ~~1200 bits/sec.~~	■ ~~2400 bits/sec.~~ ■ ~~4800 bits/sec.~~ ■ ~~9600 bits/sec.~~	■ ~~2400 bits/sec.~~ ■ ~~4800 bits/sec.~~ ■ ~~9600 bits/sec.~~ ■ ~~19200 bits/sec.~~ ■ ~~38400 bits/sec.~~ ■ ~~56000 bits/sec.~~ ■ ~~64000 bits/sec.~~

4. **LINK LAYER**

Link Transmission Procedure:	Address Field of the Link:
■ ~~Balanced Transmision~~ ■ ~~Unbalanced Transmission~~	■ ~~Not Present (Balanced Transmission Only)~~ ■ ~~One Octet~~ ■ ~~Two Octets~~ ■ ~~Structured~~ ■ ~~Unstructured~~
Frame Length (maximum length, number of octets): Not selectable in companion IEC 60870-5-104 standard	

D

When using an unbalanced link layer, the following ADSU types are returned in class 2 messages (low priority) with the indicated causes of transmission:

■ ~~The standard assignment of ADSUs to class 2 messages is used as follows~~:

■ ~~A special assignment of ADSUs to class 2 messages is used as follows~~:

5.　APPLICATION LAYER

Transmission Mode for Application Data:
Mode 1 (least significant octet first), as defined in Clause 4.10 of IEC 60870-5-4, is used exclusively in this companion stanadard.

Common Address of ADSU:

■ ~~One Octet~~

☒ Two Octets

Information Object Address:

■ ~~One Octet~~　　　　　　　☒ Structured

■ ~~Two Octets~~　　　　　　　☒ Unstructured

☒ Three Octets

Cause of Transmission:

■ ~~One Octet~~

☒ Two Octets (with originator address). Originator address is set to zero if not used.

Maximum Length of APDU: 253 (the maximum length may be reduced by the system.

Selection of standard ASDUs:

For the following lists, the boxes indicate the following: ☒ – used in standard direction; ☐ – not used; ■ – cannot be selected in IEC 60870-5-104 standard.

Process information in monitor direction

☒ <1> := Single-point information	M_SP_NA_1

6. **BASIC APPLICATION FUNCTIONS**

Station Initialization:

☒ Remote initialization

Cyclic Data Transmission:

☒ Cyclic data transmission

Read Procedure:

☒ Read procedure

Spontaneous Transmission:

☒ Spontaneous transmission

Double transmission of information objects with cause of transmission spontaneous:

The following type identifications may be transmitted in succession caused by a single status change of an information object. The particular information object addresses for which double transmission is enabled are defined in a project-specific list.

☐ Single point information: M_SP_NA_1, M_SP_TA_1, M_SP_TB_1, and M_PS_NA_1

☐ Double point information: M_DP_NA_1, M_DP_TA_1, and M_DP_TB_1

☐ Step position information: M_ST_NA_1, M_ST_TA_1, and M_ST_TB_1

☐ Bitstring of 32 bits: M_BO_NA_1, M_BO_TA_1, and M_BO_TB_1 (if defined for a specific project)

☐ Measured value, normalized value: M_ME_NA_1, M_ME_TA_1, M_ME_ND_1, and M_ME_TD_1

☐ Measured value, scaled value: M_ME_NB_1, M_ME_TB_1, and M_ME_TE_1

☐ Measured value, short floating point number: M_ME_NC_1, M_ME_TC_1, and M_ME_TF_1

Station interrogation:

☒ Global

☒ Group 1	☒ Group 5	☒ Group 9	☒ Group 13
☒ Group 2	☒ Group 6	☒ Group 10	☒ Group 14
☒ Group 3	☒ Group 7	☒ Group 11	☒ Group 15
☒ Group 4	☒ Group 8	☒ Group 12	☒ Group 16

Clock synchronization:

☒ Clock synchronization (optional, see Clause 7.6)

Command transmission:

☒ Direct command transmission

☐ Direct setpoint command transmission

☒ Select and execute command

☐ Select and execute setpoint command

☒ C_SE ACTTERM used

☒ No additional definition

☒ Short pulse duration (duration determined by a system parameter in the outstation)

☒ Long pulse duration (duration determined by a system parameter in the outstation)

☒ Persistent output

☒ Supervision of maximum delay in command direction of commands and setpoint commands

Maximum allowable delay of commands and setpoint commands: **10 s**

Transmission of integrated totals:

☒ Mode A: Local freeze with spontaneous transmission

☒ Mode B: Local freeze with counter interrogation

☒ Mode C: Freeze and transmit by counter-interrogation commands

☒ Mode D: Freeze by counter-interrogation command, frozen values reported simultaneously

☒ Counter read

☒ Counter freeze without reset

⊠ Counter freeze with reset

⊠ Counter reset

⊠ General request counter

⊠ Request counter group 1

⊠ Request counter group 2

⊠ Request counter group 3

⊠ Request counter group 4

Parameter loading:

⊠ Threshold value

☐ Smoothing factor

☐ Low limit for transmission of measured values

☐ High limit for transmission of measured values

Parameter activation:

☐ Activation/deactivation of persistent cyclic or periodic transmission of the addressed object

Test procedure:

☐ Test procedure

File transfer:

File transfer in monitor direction:

☐ Transparent file

☐ Transmission of disturbance data of protection equipment

☐ Transmission of sequences of events

☐ Transmission of sequences of recorded analog values

File transfer in control direction:

☐ Transparent file

Background scan:

☐ Background scan

Acquisition of transmission delay:

■ ~~Acquisition of transmission delay~~

Definition of time outs:

PARAMETER	DEFAULT VALUE	REMARKS	SELECTED VALUE
t_0	30 s	Timeout of connection establishment	120 s
t_1	15 s	Timeout of send or test APDUs	15 s
t_2	10 s	Timeout for acknowlegements in case of no data messages $t_2 < t_1$	10 s
t_3	20 s	Timeout for sending test frames in case of a long idle state	20 s

Maximum range of values for all time outs: 1 to 255 s, accuracy 1 s

Maximum number of outstanding I-format APDUs *k* and latest acknowledge APDUs (*w*):

PARAMETER	DEFAULT VALUE	REMARKS	SELECTED VALUE
k	12 APDUs	Maximum difference receive sequence number to send state variable	12 APDUs
w	8 APDUs	Latest acknowledge after receiving w I-format APDUs	8 APDUs

Maximum range of values *k*:   1 to 32767 (2^{15} – 1) APDUs, accuracy 1 APDU

Maximum range of values *w*:   1 to 32767 APDUs, accuracy 1 APDU
                                  Recommendation: *w* should not exceed two-thirds of *k*.

Portnumber:

PARAMETER	VALUE	REMARKS
Portnumber	2404	In all cases

RFC 2200 suite:

RFC 2200 is an official Internet Standard which describes the state of standardization of protocols used in the Internet as determined by the Internet Architecture Board (IAB). It offers a broad spectrum of actual standards used in the Internet. The suitable selection of documents from RFC 2200 defined in this standard for given projects has to be chosen by the user of this standard.

☒ Ethernet 802.3

☐ Serial X.21 interface

☐ Other selection(s) from RFC 2200 (list below if selected)

D.1.2 POINT LIST

D

The IEC 60870-5-104 data points are configured through the **SETTINGS** ⇨ **PRODUCT SETUP** ⇨⇩ **COMMUNICATIONS** ⇨⇩ **DNP / IEC104 POINT LISTS** menu. Refer to the *Communications* section of Chapter 5 for additional details.

D

The following table provides a 'Device Profile Document' in the standard format defined in the DNP 3.0 Subset Definitions Document.

Table E–1: DNP V3.00 DEVICE PROFILE (Sheet 1 of 3)

(Also see the IMPLEMENTATION TABLE in the following section)	
Vendor Name: **General Electric Multilin**	
Device Name: **UR Series Relay**	

Highest DNP Level Supported:
 	
  For Requests: **Level 2**
  For Responses: **Level 2**
	Device Function:
	
	  ☐ Master
	  ☒ **Slave**

Notable objects, functions, and/or qualifiers supported in addition to the Highest DNP Levels Supported (the complete list is described in the attached table):
 	
   Binary Inputs (Object 1)
 	
   Binary Input Changes (Object 2)
 	
   Binary Outputs (Object 10)
 	
   Control Relay Output Block (Object 12)
 	
   Binary Counters (Object 20)
 	
   Frozen Counters (Object 21)
 	
   Counter Change Event (Object 22)
 	
   Frozen Counter Event (Object 23)
 	
   Analog Inputs (Object 30)
 	
   Analog Input Changes (Object 32)
 	
   Analog Deadbands (Object 34)
 	
   Time and Date (Object 50)
 	
   File Transfer (Object 70)
 	
   Internal Indications (Object 80)	

Maximum Data Link Frame Size (octets):
 	
  Transmitted: **292**
  Received: **292**
	Maximum Application Fragment Size (octets):
	
	  Transmitted: **configurable up to 2048**
	  Received: **2048**

Maximum Data Link Re-tries:
 	
  ☒ **None**
  ☐ Fixed at 3
  ☐ Configurable
	Maximum Application Layer Re-tries:
	
	  ☒ **None**
	  ☐ Configurable

Requires Data Link Layer Confirmation:
 	
  ☒ Never
  ☐ Always
  ☐ Sometimes
  ☐ Configurable	

E

Table E–1: DNP V3.00 DEVICE PROFILE (Sheet 2 of 3)

Requires Application Layer Confirmation:

- ☐ Never
- ☐ Always
- ☒ When reporting Event Data
- ☒ When sending multi-fragment responses
- ☐ Sometimes
- ☐ Configurable

Timeouts while waiting for:

Data Link Confirm:	☒ None	☐ Fixed at ____	☐ Variable	☐ Configurable
Complete Appl. Fragment:	☒ **None**	☐ Fixed at ____	☐ Variable	☐ Configurable
Application Confirm:	☐ None	☒ **Fixed at 10 s**	☐ Variable	☐ Configurable
Complete Appl. Response:	☒ **None**	☐ Fixed at ____	☐ Variable	☐ Configurable

Others:

Transmission Delay:	**No intentional delay**
Need Time Interval:	**Configurable (default = 24 hrs.)**
Select/Operate Arm Timeout:	**10 s**
Binary input change scanning period:	**8 times per power system cycle**
Analog input change scanning period:	**500 ms**
Counter change scanning period:	**500 ms**
Frozen counter event scanning period:	**500 ms**
Unsolicited response notification delay:	**100 ms**
Unsolicited response retry delay	**configurable 0 to 60 sec.**

Sends/Executes Control Operations:

WRITE Binary Outputs	☒ **Never**	☐ Always	☐ Sometimes	☐ Configurable

DIRECT OPERATE	☐ Never	☒ **Always**	☐ Sometimes	☐ Configurable
DIRECT OPERATE – NO ACK	☐ Never	☒ **Always**	☐ Sometimes	☐ Configurable

Count > 1	☒ **Never**	☐ Always	☐ Sometimes	☐ Configurable
Pulse On	☐ Never	☐ Always	☒ **Sometimes**	☐ Configurable
Pulse Off	☐ Never	☐ Always	☒ **Sometimes**	☐ Configurable
Latch On	☐ Never	☐ Always	☒ **Sometimes**	☐ Configurable
Latch Off	☐ Never	☐ Always	☒ **Sometimes**	☐ Configurable

Queue	☒ **Never**	☐ Always	☐ Sometimes	☐ Configurable
Clear Queue	☒ **Never**	☐ Always	☐ Sometimes	☐ Configurable

Explanation of 'Sometimes': Object 12 points are mapped to UR Virtual Inputs. The persistence of Virtual Inputs is determined by the **VIRTUAL INPUT X TYPE** settings. Both "Pulse On" and "Latch On" operations perform the same function in the UR; that is, the appropriate Virtual Input is put into the "On" state. If the Virtual Input is set to "Self-Reset", it will reset after one pass of FlexLogic™. The On/Off times and Count value are ignored. "Pulse Off" and "Latch Off" operations put the appropriate Virtual Input into the "Off" state. "Trip" and "Close" operations both put the appropriate Virtual Input into the "On" state.

Table E–1: DNP V3.00 DEVICE PROFILE (Sheet 3 of 3)

Reports Binary Input Change Events when no specific variation requested: ☐ Never ☒ **Only time-tagged** ☐ Only non-time-tagged ☐ Configurable	**Reports time-tagged Binary Input Change Events when no specific variation requested:** ☐ Never ☒ Binary Input Change With Time ☐ Binary Input Change With Relative Time ☐ Configurable (attach explanation)
Sends Unsolicited Responses: ☐ **Never** ☒ Configurable ☐ Only certain objects ☐ Sometimes (attach explanation) ☒ ENABLE/DISABLE unsolicited Function codes supported	**Sends Static Data in Unsolicited Responses:** ☒ Never ☐ When Device Restarts ☐ When Status Flags Change No other options are permitted.
Default Counter Object/Variation: ☐ No Counters Reported ☐ Configurable (attach explanation) ☒ **Default Object: 20** **Default Variation: 1** ☒ **Point-by-point list attached**	**Counters Roll Over at:** ☐ No Counters Reported ☐ Configurable (attach explanation) ☒ **16 Bits (Counter 8)** ☒ **32 Bits (Counters 0 to 7, 9)** ☐ Other Value: _____ ☒ **Point-by-point list attached**
Sends Multi-Fragment Responses: ☒ **Yes** ☐ No	

E

The following table identifies the variations, function codes, and qualifiers supported by the C60 in both request messages and in response messages. For static (non-change-event) objects, requests sent with qualifiers 00, 01, 06, 07, or 08, will be responded with qualifiers 00 or 01. Static object requests sent with qualifiers 17 or 28 will be responded with qualifiers 17 or 28. For change-event objects, qualifiers 17 or 28 are always responded.

Table E–2: IMPLEMENTATION TABLE (Sheet 1 of 4)

OBJECT			REQUEST		RESPONSE	
OBJECT NO.	VARIATION NO.	DESCRIPTION	FUNCTION CODES (DEC)	QUALIFIER CODES (HEX)	FUNCTION CODES (DEC)	QUALIFIER CODES (HEX)
1	0	Binary Input (Variation 0 is used to request default variation)	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)		
	1	Binary Input	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
	2	Binary Input with Status	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
2	0	Binary Input Change (Variation 0 is used to request default variation)	1 (read)	06 (no range, or all) 07, 08 (limited quantity)		
	1	Binary Input Change without Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	2	Binary Input Change with Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response 130 (unsol. resp.)	17, 28 (index)
	3	Binary Input Change with Relative Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)		
10	0	Binary Output Status (Variation 0 is used to request default variation)	1 (read)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)		
	2	Binary Output Status	1 (read)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
12	1	Control Relay Output Block	3 (select) 4 (operate) 5 (direct op) 6 (dir. op, noack)	00, 01 (start-stop) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	echo of request
20	0	Binary Counter (Variation 0 is used to request default variation)	1 (read) 7 (freeze) 8 (freeze noack) 9 (freeze clear) 10 (frz. cl. noack) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)		
	1	32-Bit Binary Counter	1 (read) 7 (freeze) 8 (freeze noack) 9 (freeze clear) 10 (frz. cl. noack) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*

Note 1: A default variation refers to the variation responded when variation 0 is requested and/or in class 0, 1, 2, or 3 scans. The default variations for object types 1, 2, 20, 21, 22, 23, 30, and 32 are selected via relay settings. Refer to the *Communications* section in Chapter 5 for details. This optimizes the class 0 poll data size.

Note 2: For static (non-change-event) objects, qualifiers 17 or 28 are only responded when a request is sent with qualifiers 17 or 28, respectively. Otherwise, static object requests sent with qualifiers 00, 01, 06, 07, or 08, will be responded with qualifiers 00 or 01 (for change-event objects, qualifiers 17 or 28 are always responded.)

Note 3: Cold restarts are implemented the same as warm restarts – the C60 is not restarted, but the DNP process is restarted.

Table E–2: IMPLEMENTATION TABLE (Sheet 2 of 4)

OBJECT			REQUEST		RESPONSE	
OBJECT NO.	VARIATION NO.	DESCRIPTION	FUNCTION CODES (DEC)	QUALIFIER CODES (HEX)	FUNCTION CODES (DEC)	QUALIFIER CODES (HEX)
20 cont'd	2	16-Bit Binary Counter	1 (read) 7 (freeze) 8 (freeze noack) 9 (freeze clear) 10 (frz. cl. noack) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
	5	32-Bit Binary Counter without Flag	1 (read) 7 (freeze) 8 (freeze noack) 9 (freeze clear) 10 (frz. cl. noack) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
	6	16-Bit Binary Counter without Flag	1 (read) 7 (freeze) 8 (freeze noack) 9 (freeze clear) 10 (frz. cl. noack) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
21	0	Frozen Counter (Variation 0 is used to request default variation)	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)		
	1	32-Bit Frozen Counter	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
	2	16-Bit Frozen Counter	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
	9	32-Bit Frozen Counter without Flag	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
	10	16-Bit Frozen Counter without Flag	1 (read) 22 (assign class)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
22	0	Counter Change Event (Variation 0 is used to request default variation)	1 (read)	06 (no range, or all) 07, 08 (limited quantity)		
	1	32-Bit Counter Change Event	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	2	16-Bit Counter Change Event	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	5	32-Bit Counter Change Event with Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	6	16-Bit Counter Change Event with Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
23	0	Frozen Counter Event (Variation 0 is used to request default variation)	1 (read)	06 (no range, or all) 07, 08 (limited quantity)		
	1	32-Bit Frozen Counter Event	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
	2	16-Bit Frozen Counter Event	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)

Note 1: A default variation refers to the variation responded when variation 0 is requested and/or in class 0, 1, 2, or 3 scans. The default variations for object types 1, 2, 20, 21, 22, 23, 30, and 32 are selected via relay settings. Refer to the *Communications* section in Chapter 5 for details. This optimizes the class 0 poll data size.

Note 2: For static (non-change-event) objects, qualifiers 17 or 28 are only responded when a request is sent with qualifiers 17 or 28, respectively. Otherwise, static object requests sent with qualifiers 00, 01, 06, 07, or 08, will be responded with qualifiers 00 or 01 (for change-event objects, qualifiers 17 or 28 are always responded.)

Note 3: Cold restarts are implemented the same as warm restarts – the C60 is not restarted, but the DNP process is restarted.

E

Table E–2: IMPLEMENTATION TABLE (Sheet 3 of 4)

OBJECT			REQUEST		RESPONSE	
OBJECT NO.	VARIATION NO.	DESCRIPTION	FUNCTION CODES (DEC)	QUALIFIER CODES (HEX)	FUNCTION CODES (DEC)	QUALIFIER CODES (HEX)

	7	short floating point Analog Change Event with Time	1 (read)	06 (no range, or all) 07, 08 (limited quantity)	129 (response) 130 (unsol. resp.)	17, 28 (index)
34	0	Analog Input Reporting Deadband (Variation 0 is used to request default variation)	1 (read)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)		
	1	16-bit Analog Input Reporting Deadband (default – see Note 1)	1 (read)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
			2 (write)	00, 01 (start-stop) 07, 08 (limited quantity) 17, 28 (index)		

Note 1: A default variation refers to the variation responded when variation 0 is requested and/or in class 0, 1, 2, or 3 scans. The default variations for object types 1, 2, 20, 21, 22, 23, 30, and 32 are selected via relay settings. Refer to the *Communications* section in Chapter 5 for details. This optimizes the class 0 poll data size.

Note 2: For static (non-change-event) objects, qualifiers 17 or 28 are only responded when a request is sent with qualifiers 17 or 28, respectively. Otherwise, static object requests sent with qualifiers 00, 01, 06, 07, or 08, will be responded with qualifiers 00 or 01 (for change-event objects, qualifiers 17 or 28 are always responded.)

Note 3: Cold restarts are implemented the same as warm restarts – the C60 is not restarted, but the DNP process is restarted.

Table E–2: IMPLEMENTATION TABLE (Sheet 4 of 4)

OBJECT			REQUEST		RESPONSE	
OBJECT NO.	VARIATION NO.	DESCRIPTION	FUNCTION CODES (DEC)	QUALIFIER CODES (HEX)	FUNCTION CODES (DEC)	QUALIFIER CODES (HEX)
34 cont'd	2	32-bit Analog Input Reporting Deadband	1 (read)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
			2 (write)	00, 01 (start-stop) 07, 08 (limited quantity) 17, 28 (index)		
	3	Short floating point Analog Input Reporting Deadband	1 (read)	00, 01 (start-stop) 06 (no range, or all) 07, 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
50	1	Time and Date (default – see Note 1)	1 (read) 2 (write)	00, 01 (start-stop) 06 (no range, or all) 07 (limited qty=1) 08 (limited quantity) 17, 28 (index)	129 (response)	00, 01 (start-stop) 17, 28 (index) *(see Note 2)*
52	2	Time Delay Fine			129 (response)	07 (limited quantity) (quantity = 1)
60	0	Class 0, 1, 2, and 3 Data	1 (read) 20 (enable unsol) 21 (disable unsol) 22 (assign class)	06 (no range, or all)		
	1	Class 0 Data	1 (read) 22 (assign class)	06 (no range, or all)		
	2	Class 1 Data	1 (read) 20 (enable unsol) 21 (disable unsol) 22 (assign class)	06 (no range, or all) 07, 08 (limited quantity)		
	3	Class 2 Data				
	4	Class 3 Data				
70	0	File event - any variation	1 (read)	06 (no range, or all) 07, 08 (limited quantity)		
			22 (assign class)	06 (no range, or all)		
	2	File authentication	29 (authenticate)	5b (free format)	129 (response)	5b (free format)
	3	File command	25 (open) 27 (delete)	5b (free format)		
	4	File command status	26 (close) 30 (abort)	5b (free format)	129 (response) 130 (unsol. resp.)	5b (free format)
	5	File transfer	1 (read) 2 (write)	5b (free format)	129 (response) 130 (unsol. resp.)	5b (free format)
	6	File transfer status			129 (response) 130 (unsol. resp.)	5b (free format)
	7	File descriptor	28 (get file info.)	5b (free format)	129 (response) 130 (unsol. resp.)	5b (free format)
80	1	Internal Indications	1 (read)	00, 01 (start-stop) (index =7)	129 (response)	00, 01 (start-stop)
			2 (write) *(see Note 3)*	00 (start-stop) (index =7)		
---		No Object (function code only) *see Note 3*	13 (cold restart)			
---		No Object (function code only)	14 (warm restart)			
---		No Object (function code only)	23 (delay meas.)			

Note 1: A default variation refers to the variation responded when variation 0 is requested and/or in class 0, 1, 2, or 3 scans. The default varia-tions for object types 1, 2, 20, 21, 22, 23, 30, and 32 are selected via relay settings. Refer to the *Communications* section in Chapter 5 for details. This optimizes the class 0 poll data size.

Note 2: For static (non-change-event) objects, qualifiers 17 or 28 are only responded when a request is sent with qualifiers 17 or 28, respec-tively. Otherwise, static object requests sent with qualifiers 00, 01, 06, 07, or 08, will be responded with qualifiers 00 or 01 (for change-event objects, qualifiers 17 or 28 are always responded.)

Note 3: Cold restarts are implemented the same as warm restarts – the C60 is not restarted, but the DNP process is restarted.

E

The DNP binary input data points are configured through the **PRODUCT SETUP** ⇨⇩ **COMMUNICATIONS** ⇨⇩ **DNP / IEC104 POINT LISTS** ⇨ **BINARY INPUT / MSP POINTS** menu. Refer to the *Communications* section of Chapter 5 for additional details. When a freeze function is performed on a binary counter point, the frozen value is available in the corresponding frozen counter point.

BINARY INPUT POINTS

    Static (Steady-State) Object Number: **1**

    Change Event Object Number: **2**

    Request Function Codes supported: **1 (read), 22 (assign class)**

    Static Variation reported when variation 0 requested: **2 (Binary Input with status), Configurable**

    Change Event Variation reported when variation 0 requested: **2 (Binary Input Change with Time), Configurable**

    Change Event Scan Rate: **8 times per power system cycle**

    Change Event Buffer Size: **500**

    Default Class for All Points: **1**

E

Supported Control Relay Output Block fields: Pulse On, Pulse Off, Latch On, Latch Off, Paired Trip, Paired Close.

BINARY OUTPUT STATUS POINTS

Object Number: **10**

Request Function Codes supported: **1 (read)**

Default Variation reported when Variation 0 requested: **2 (Binary Output Status)**

CONTROL RELAY OUTPUT BLOCKS

Object Number: **12**

Request Function Codes supported: **3 (select), 4 (operate), 5 (direct operate), 6 (direct operate, noack)**

E

The following table lists both Binary Counters (Object 20) and Frozen Counters (Object 21). When a freeze function is performed on a Binary Counter point, the frozen value is available in the corresponding Frozen Counter point.

BINARY COUNTERS

Static (Steady-State) Object Number: **20**

Change Event Object Number: **22**

Request Function Codes supported: **1 (read), 7 (freeze), 8 (freeze noack), 9 (freeze and clear),
10 (freeze and clear, noack), 22 (assign class)**

Static Variation reported when variation 0 requested: **1 (32-Bit Binary Counter with Flag)**

Change Event Variation reported when variation 0 requested: **1 (32-Bit Counter Change Event without time)**

Change Event Buffer Size: **10**

Default Class for all points: **3**

FROZEN COUNTERS

Static (Steady-State) Object Number: **21**

Change Event Object Number: **23**

Request Function Codes supported: **1 (read)**

Static Variation reported when variation 0 requested: **1 (32-Bit Frozen Counter with Flag)**

Change Event Variation reported when variation 0 requested: **1 (32-Bit Frozen Counter Event without time)**

Change Event Buffer Size: **10**

Default Class for all points: **3**

Table E–4: BINARY AND FROZEN COUNTERS

POINT INDEX	NAME/DESCRIPTION
0	Digital Counter 1
1	Digital Counter 2
2	Digital Counter 3
3	Digital Counter 4
4	Digital Counter 5
5	Digital Counter 6
6	Digital Counter 7
7	Digital Counter 8
8	Oscillography Trigger Count
9	Events Since Last Clear

A counter freeze command has no meaning for counters 8 and 9. C60 Digital Counter values are represented as 32-bit integers. The DNP 3.0 protocol defines counters to be unsigned integers. Care should be taken when interpreting negative counter values.

The DNP analog input data points are configured through the **PRODUCT SETUP** ⇨⇩ **COMMUNICATIONS** ⇨⇩ **DNP / IEC104 POINT LISTS** ⇨ **ANALOG INPUT / MME POINTS** menu. Refer to the *Communications* section of Chapter 5 for additional details.

It is important to note that 16-bit and 32-bit variations of analog inputs are transmitted through DNP as signed numbers. Even for analog input points that are not valid as negative values, the maximum positive representation is 32767 for 16-bit values and 2147483647 for 32-bit values. This is a DNP requirement.

The deadbands for all Analog Input points are in the same units as the Analog Input quantity. For example, an Analog Input quantity measured in volts has a corresponding deadband in units of volts. This is in conformance with DNP Technical Bulletin 9809-001: Analog Input Reporting Deadband. Relay settings are available to set default deadband values according to data type. Deadbands for individual Analog Input Points can be set using DNP Object 34.

Static (Steady-State) Object Number: **30**

Change Event Object Number: **32**

Request Function Codes supported: **1 (read), 2 (write, deadbands only), 22 (assign class)**

Static Variation reported when variation 0 requested: **1 (32-Bit Analog Input)**

Change Event Variation reported when variation 0 requested: **1 (Analog Change Event without Time)**

Change Event Scan Rate: defaults to **500 ms**

Change Event Buffer Size: **256**

Default Class for all Points: **2**

3-4	3-5	Update	Updated MODULE WITHDRAWAL AND INSERTION section
4-4	4-4	Update	Updated FACEPLATE section
4-5	4-5	Update	Updated LED INDICATORS section
4-7	4-8	Update	Updated CUSTOM LABELING OF LEDS section
4-13	4-20	Update	Updated ENTERING INITIAL PASSWORDS section
5-8	5-8	Update	Updated PASSWORD SECURITY section
5-37	5-38	Update	Updated USER-PROGRAMMABLE LEDS section
5-42	5-43	Update	Updated CONTROL PUSHBUTTONS section
5-43	5-44	Update	Updated USER-PROGRAMMABLE PUSHBUTTONS section
5-49	5-51	Update	Updated DIRECT INPUTS AND OUTPUTS section
5-72	5-76	Update	Updated FLEXLOGIC™ OPERANDS table
---	5-165	Add	Added TRIP BUS section
6-19	6-19	Update	Updated FAULT REPORTS actual values section
7-3	7-3	Update	Updated RELAY SELF-TESTS section
---	8-3	Add	Added FAULT LOCATOR theory of operation section
B-7	B-7	Update	Updated MODBUS PASSWORD OPERATION section
B-8	B-8	Update	Updated MODBUS MEMORY MAP section
---	C-2	Add	Added GGIO4: GENERIC ANALOG MEASURED VALUES section
C-7	C-7	Update	Updated CONFIGURABLE GOOSE section

F

A.................... Ampere
AC .... Alternating Current
A/D .... Analog to Digital
AE .... Accidental Energization, Application Entity
AMP .... Ampere
ANG .... Angle
ANSI.............. American National Standards Institute
AR .... Automatic Reclosure
ASDU .... Application-layer Service Data Unit
ASYM............ Asymmetry
AUTO .... Automatic
AUX............... Auxiliary
AVG............... Average

BER............... Bit Error Rate
BF.................. Breaker Fail
BFI................. Breaker Failure Initiate
BKR............... Breaker
BLK .... Block
BLKG............. Blocking
BPNT............. Breakpoint of a characteristic
BRKR .... Breaker

CAP............... Capacitor
CC .... Coupling Capacitor
CCVT .... Coupling Capacitor Voltage Transformer
CFG............... Configure / Configurable
.CFG.............. Filename extension for oscillography files
CHK............... Check
CHNL .... Channel
CLS .... Close
CLSD............. Closed
CMND .... Command
CMPRSN........ Comparison
CO................. Contact Output
COM.............. Communication
COMM........... Communications
COMP .... Compensated, Comparison
CONN........... Connection
CONT........... Continuous, Contact
CO-ORD........ Coordination
CPU............... Central Processing Unit
CRC .... Cyclic Redundancy Code
CRT, CRNT .... Current
CSA............... Canadian Standards Association
CT .... Current Transformer
CVT .... Capacitive Voltage Transformer

D/A .... Digital to Analog
DC (dc)........... Direct Current
DD .... Disturbance Detector
DFLT .... Default
DGNST........... Diagnostics
DI.................... Digital Input
DIFF .... Differential
DIR .... Directional
DISCREP .... Discrepancy
DIST .... Distance
DMD .... Demand
DNP................ Distributed Network Protocol
DPO .... Dropout
DSP............... Digital Signal Processor
dt .... Rate of Change
DTT .... Direct Transfer Trip
DUTT............. Direct Under-reaching Transfer Trip

ENCRMNT ..... Encroachment
EPRI.............. Electric Power Research Institute
.EVT .... Filename extension for event recorder files
EXT .... Extension, External

F .... Field
FAIL............... Failure
FD .... Fault Detector
FDH............... Fault Detector high-set
FDL .... Fault Detector low-set
FLA................ Full Load Current
FO .... Fiber Optic

FREQ............. Frequency
FSK............... Frequency-Shift Keying
FTP .... File Transfer Protocol
FxE .... FlexElement™
FWD.............. Forward

G .... Generator
GE................. General Electric
GND.............. Ground
GNTR............ Generator
GOOSE......... General Object Oriented Substation Event
GPS .... Global Positioning System

HARM .... Harmonic / Harmonics
HCT .... High Current Time
HGF .... High-Impedance Ground Fault (CT)
HIZ .... High-Impedance and Arcing Ground
HMI .... Human-Machine Interface
HTTP .... Hyper Text Transfer Protocol
HYB .... Hybrid

I..................... Instantaneous
I_0................. Zero Sequence current
I_1 .... Positive Sequence current
I_2 .... Negative Sequence current
IA .... Phase A current
IAB .... Phase A minus B current
IB .... Phase B current
IBC................ Phase B minus C current
IC .... Phase C current
ICA .... Phase C minus A current
ID .... Identification
IED................ Intelligent Electronic Device
IEC................ International Electrotechnical Commission
IEEE.............. Institute of Electrical and Electronic Engineers
IG .... Ground (not residual) current
Igd................. Differential Ground current
IN .... CT Residual Current (3Io) or Input
INC SEQ .... Incomplete Sequence
INIT .... Initiate
INST.............. Instantaneous
INV .... Inverse
I/O .... Input/Output
IOC .... Instantaneous Overcurrent
IOV................ Instantaneous Overvoltage
IRIG .... Inter-Range Instrumentation Group
ISO............... International Standards Organization
IUV................ Instantaneous Undervoltage

K0 .... Zero Sequence Current Compensation
kA.................. kiloAmpere
kV.................. kiloVolt

LED............... Light Emitting Diode
LEO.............. Line End Open
LFT BLD .... Left Blinder
LOOP............ Loopback
LPU............... Line Pickup
LRA............... Locked-Rotor Current
LTC .... Load Tap-Changer

M.................... Machine
mA .... MilliAmpere
MAG.............. Magnitude
MAN.............. Manual / Manually
MAX .... Maximum
MIC .... Model Implementation Conformance
MIN .... Minimum, Minutes
MMI............... Man Machine Interface
MMS .... Manufacturing Message Specification
MRT .... Minimum Response Time
MSG.............. Message
MTA.............. Maximum Torque Angle
MTR .... Motor
MVA .... MegaVolt-Ampere (total 3-phase)
MVA_A .... MegaVolt-Ampere (phase A)
MVA_B.......... MegaVolt-Ampere (phase B)
MVA_C.......... MegaVolt-Ampere (phase C)

MVAR .... MegaVar (total 3-phase)
MVAR_A......... MegaVar (phase A)
MVAR_B........ MegaVar (phase B)
MVAR_C .... MegaVar (phase C)
MVARH .... MegaVar-Hour
MW................ MegaWatt (total 3-phase)
MW_A .... MegaWatt (phase A)
MW_B .... MegaWatt (phase B)
MW_C .... MegaWatt (phase C)
MWH .... MegaWatt-Hour

N.................... Neutral
N/A, n/a .... Not Applicable
NEG .... Negative
NMPLT .... Nameplate
NOM.............. Nominal
NSAP .... Network Service Access Protocol
NTR............... Neutral

O .... Over
OC, O/C .... Overcurrent
O/P, Op........... Output
OP .... Operate
OPER .... Operate
OPERATG...... Operating
O/S .... Operating System
OSI .... Open Systems Interconnect
OSB............... Out-of-Step Blocking
OUT............... Output
OV .... Overvoltage
OVERFREQ ... Overfrequency
OVLD .... Overload

P.................... Phase
PC .... Phase Comparison, Personal Computer
PCNT .... Percent
PF.................. Power Factor (total 3-phase)
PF_A .... Power Factor (phase A)
PF_B .... Power Factor (phase B)
PF_C .... Power Factor (phase C)
PFLL.............. Phase and Frequency Lock Loop
PHS............... Phase
PICS.............. Protocol Implementation & Conformance
                       Statement
PKP .... Pickup
PLC .... Power Line Carrier
POS............... Positive
POTT............. Permissive Over-reaching Transfer Trip
PRESS .... Pressure
PRI .... Primary
PROT .... Protection
PSEL .... Presentation Selector
pu .... Per Unit
PUIB.............. Pickup Current Block
PUIT .... Pickup Current Trip
PUSHBTN ...... Pushbutton
PUTT............. Permissive Under-reaching Transfer Trip
PWM .... Pulse Width Modulated
PWR.............. Power

QUAD............ Quadrilateral

R.................... Rate, Reverse
RCA................ Reach Characteristic Angle
REF .... Reference
REM .... Remote
REV............... Reverse
RI................... Reclose Initiate
RIP .... Reclose In Progress
RGT BLD........ Right Blinder
ROD .... Remote Open Detector
RST .... Reset
RSTR .... Restrained
RTD............... Resistance Temperature Detector
RTU............... Remote Terminal Unit
RX (Rx) .... Receive, Receiver

s .... second
S.................... Sensitive

SAT .... CT Saturation
SBO .... Select Before Operate
SCADA .... Supervisory Control and Data Acquisition
SEC .... Secondary
SEL .... Select / Selector / Selection
SENS .... Sensitive
SEQ .... Sequence
SIR................ Source Impedance Ratio
SNTP .... Simple Network Time Protocol
SRC .... Source
SSB............... Single Side Band
SSEL............. Session Selector
STATS........... Statistics
SUPN............ Supervision
SUPV .... Supervise / Supervision
SV .... Supervision, Service
SYNC............ Synchrocheck
SYNCHCHK... Synchrocheck

T.................... Time, transformer
TC .... Thermal Capacity
TCP .... Transmission Control Protocol
TCU .... Thermal Capacity Used
TD MULT........ Time Dial Multiplier
TEMP............ Temperature
TFTP .... Trivial File Transfer Protocol
THD .... Total Harmonic Distortion
TMR .... Timer
TOC .... Time Overcurrent
TOV.............. Time Overvoltage
TRANS.......... Transient
TRANSF .... Transfer
TSEL.............. Transport Selector
TUC .... Time Undercurrent
TUV.............. Time Undervoltage
TX (Tx) .... Transmit, Transmitter

U .... Under
UC................. Undercurrent
UCA .... Utility Communications Architecture
UDP .... User Datagram Protocol
UL .... Underwriters Laboratories
UNBAL.......... Unbalance
UR................. Universal Relay
URC .... Universal Recloser Control
.URS .... Filename extension for settings files
UV .... Undervoltage

V/Hz .... Volts per Hertz
V_0 .... Zero Sequence voltage
V_1 .... Positive Sequence voltage
V_2 .... Negative Sequence voltage
VA .... Phase A voltage
VAB................ Phase A to B voltage
VAG............... Phase A to Ground voltage
VARH .... Var-hour voltage
VB .... Phase B voltage
VBA............... Phase B to A voltage
VBG .... Phase B to Ground voltage
VC................. Phase C voltage
VCA .... Phase C to A voltage
VCG .... Phase C to Ground voltage
VF .... Variable Frequency
VIBR .... Vibration
VT .... Voltage Transformer
VTFF............. Voltage Transformer Fuse Failure
VTLOS .... Voltage Transformer Loss Of Signal

WDG .... Winding
WH................. Watt-hour
w/ opt .... With Option
WRT.............. With Respect To

X .... Reactance
XDUCER........ Transducer
XFMR............ Transformer

Z.................... Impedance, Zone

F

GE MULTILIN RELAY WARRANTY

General Electric Multilin Inc. (GE Multilin) warrants each relay it manufactures to be free from defects in material and workmanship under normal use and service for a period of 24 months from date of shipment from factory.

In the event of a failure covered by warranty, GE Multilin will undertake to repair or replace the relay providing the warrantor determined that it is defective and it is returned with all transportation charges prepaid to an authorized service centre or the factory. Repairs or replacement under warranty will be made without charge.

Warranty shall not apply to any relay which has been subject to misuse, negligence, accident, incorrect installation or use not in accordance with instructions nor any unit that has been altered outside a GE Multilin authorized factory outlet.

GE Multilin is not liable for special, indirect or consequential damages or for loss of profit or for expenses sustained as a result of a relay malfunction, incorrect application or adjustment.

For complete text of Warranty (including limitations and disclaimers), refer to GE Multilin Standard Conditions of Sale.

F
