| 5000 | 315 | 280 | 270 | 265 |

## Adders for Special Features

1) 50 Hertz - Add 15\%; Refer to Greenville for other frequencies
2) Voltages between 24-90 Volts - Add $\mathbf{\$ 6 . 0 0}$ list
3) Voltages below 24 Volts - Add $\$ 12.00$ list.
4) Dual Primary - Add 10\% $\$ 5.00 \mathrm{~min}$.
5) Dual Secondary - Add $10 \% \$ 5.00 \mathrm{~min}$.
6) $220 / 380$ Volts Primary - Use next higher

VA base price.
7) Taps - Add $\$ 5.00$ list each to base.
8) Fungus Proofing - Add $\$ 10.00$ list.
9) Export or special packing - Add $\mathbf{\$ 1 0 . 0 0}$ list or $10 \%$, whichever is greater.

## Note:

After final list price is determined, refer to SP 46-800, discount symbol STD-5 for applicable multiplier to obtain appropriate net price.

For delivery refer to 46-815 LWE A Shipping Schedule

Westinghouse

## All transformers on this page are listed by Underwriters' Laboratory, Inc. Type AP Machine Tool Transformer.

Application The UL listed and labeled type AP transformers provide stepped-down voltages to machine tool control devices. This enables control circuits to be isolated from all power and lighting circuits, thus allowing the use of grounded or ungrounded circuits that are independent of the power or lighting grounds. Greater safety is afforded the operator and the more rugged 115 -volt coils can be used on the control devices regardless of the line voltage.

The Type AP control transformers feature an encapsulated core and coil which provides a totally enclosed, non-ventilated construction. Smaller than open core and coil type units, connections are made with the convenient screw type terminal board. For ease of installation two types of mounting are provided. Select a design with the base plate arranged for bottom mounting (Fig. 1) or for side/wall mounting (Fig 2).

240/480 Volt Primary No Taps to 120/240 Secondary Single Phase, 60 Hertz - Class $155,80^{\circ} \mathrm{C}$ Rise - 3 Through 10 Kva

Class 185, $115^{\circ} \mathrm{C}$ Rise -15 Kva

## Control Transformers <br> Type AP Machine Tool

$240 / 480$ to $120 / 240$ Volts 60 Cycles, Single Phase

Performance Data

The purpose of the regulation curves shown is to indicate the volt-amperes which may be taken from the transformer secondary at various power factors and still maintain 95\% of the rated secondary voltage. Since most magnetic devices will operate at $85 \%$ of rated voltage (NEMA Standard), this provides a safety factor of $10 \%$ for undervoltage on the primary.

To use the curves:

1. Vectorially add the maximum inrush voltamperes to the continuous volt-amperes connected to the transformer.

## 2. Determine the power factor of the above condition.

For most solenoids, contactors and similar magnetic devices, $20 \%$ is reasonable value to use. For motor starting, $50 \%$ to $60 \%$ is a reasonable value.
3. Locate the point determined by steps 1 and 2 on the graph. Choose the transformer rating whose curve is next above this point. In cases where the point falls slightly above a curve, the safety factor previously mentioned will allow the user to pick the next lower rating if the primary voltage is close to nominal.

## Non-Standard Type MTA

## Transformers and Modifications

The following information and prices must be used to price any Non-Standard Type MTA Control Transformer not listed in the previous tables.
Base list prices are first determined from the table below; then rules 1 through 10 are applied to the base list price to determine total list price of a non-standard unit.

| Non-Standard Base List Prices 90-600 Volts, Single Phase |  |
| :---: | :---: |
| Volt-Amperes | Base List Price |
| 50 | \$ 15 |
| 75 | 18 |
| 100 | 20 |
| 150 | 22 |
| 200 | 25 |
| 250 | 30 |
| 300 | 33 |
| 350 | 36 |
| 500 | 42 |
| 750 | 57 |
| 1000 | 70 |
| 1500 | 92 |
| 2000 | 122 |
| 3000 | 157 |
| 5000 | 252 |

Rule 1: List prices above apply only to 60 Hertz transformers. For 50 Hertz, add 15\% to base list price. Refer to Westinghouse for other frequencies.
Rule 2: For voltages between 24 and 90 volts, add $\$ 6.00$ to base list price.
Rule 3: For voltages below 24 volts, add $\$ 12.00$ to base list price.
Rule 4: For dual primary, add $5 \%$ to base list price.
Rule 5: For dual secondary, add $5 \%$ to base list price.
Rule 6: For 220/380 volt primary, use the list price of next higher va rating.
Rule 7: For tap voltages, add $\$ 4.75$ to base list price.
Rule 8: For fungus proofing, add $\$ 9.50$ to base list price.
Rule 9: For export packing, add $\mathbf{\$ 9 . 5 0}$ to base list price.
Rule 10: Quantity Adders: The following additions apply to Non-Standard Transformer List Prices:

| Quantity | List Price Addition |
| :--- | :--- |
| 1 | $\$ 50.00$ |

## Non-Standard Type MTC

Transformers and Modifications The following information and prices must be used to price any Non-Standard Type MTC Control Transformer not listed in the previous table.
Base list prices are first determined from the table below; then rules 1 through 10 are applied to the base list price to determine total list price of a non-standard unit.

| $\begin{aligned} & \text { Non-Stanc } \\ & 90-600 \text { Vo } \end{aligned}$ | Prices <br> e |
| :---: | :---: |
| Volt-Amperes | Base List Price |
| 50 | \$ 17 |
| 75 | 20 |
| 100 | 22 |
| 150 | 24 |
| 200 | 28 |
| 250 | 33 |
| 300 | 38 |
| 350 | 43 |
| 500 | 50 |
| 750 | 66 |
| 1000 | 81 |
| 1500 | 104 |
| 2000 | 134 |
| 3000 | 176 |
| 5000 | 277 |

Rule 1: List prices above apply only to 60 Hertz transformers. For 50 Hertz, add 15\% to base list price. Refer to Westinghouse for other frequencies.

Rule 2: For voltages between 24 and 90 volts, add $\$ 6.00$ to base list price.
Rule 3: For voltages below 24 volts, add $\$ 12.00$ to base list price.

Rule 4: For dual primary, add 5\% to base list price.
Rule 5: For dual secondary, add $5 \%$ to base list price.
Rule 6: For 220/380 volt primary, use the list price of next higher va rating.
Rule 7: For tap voltages, add $\$ 4.75$ to base list price.

Rule 8: For fungus proofing, add $\mathbf{\$ 9 . 5 0}$ to base list price.
Rule 9: For export packing, add $\mathbf{\$ 9 . 5 0}$ to base list price.

Rule 10: Quantity Adders: The following additions apply to Non-Standard Transformer List Prices

| Quantity | List Price Addition |
| :--- | ---: |
| 1 | $\$ 50.00$ |
| $2-9$ | 15.00 |
| $10-24$ | 5.00 |

## Westinghouse

# Control Transformers <br> Type LC for Control Circuits 

Single Phase, 50, 60 Cycles
115 to 600 Volts Hv, 6 to 240 Volts Lv

These control transformers are used in a variety of control circuits for practical and economical operation of small motors, oil burner controls, domestic furnace dampers, relays, heating elements, pilot lights, solenoid operated valves, electrically operated gas valves, switchboard control circuits, burglar alarm systems, signalling systems and similar operations.

## Design Features

Transformers are small size and light weight. They may be installed near the load to be supplied-mounted overhead, beside or in the control panel of the machine served.

Type LC conform to NEMA standards governing manufacture and performance of dry type transformers. Type LC is listed by Underwriters' Laboratories.

## Construction Features

The highest quality silicon steel laminations are used in the cores. Annealing, after punching, minimizes losses. Standard transformers are supplied with single primary and single secondary windings. The coils are concentrically wound on special equipment to obtain uniformity and thorough insulation. Class A insulation is used. The core and coil assembly is impregnated with special insulating varnish which excludes dust and moisture.

## Leads

Standard, flexible leads are supplied on Type LC transformers.

## Rating Information

A stamping containing all rating information is located on the top of each transformer.

## End Covers

Type LC transformers are supplied with end covers to give complete protection and a neat finished appearance.

## Voltage Compensation

Type LC transformers are designed to NEMA standards. This requires an adjustment in turn ratio to compensate for regulation. These units are compensated to deliver rated kva at 100 percent power factor at approximately rated voltage from
the secondary, when rated voltage is supplied to the primary.

When attempting to use a compensated transformer in the reverse direction by applying rated voltage to the low voltage side and loading at rated current on the high voltage side, the output voltage will be considerably lower than rated. The magnitude of this reduction will be approximately equal to twice the normal regulation voltage.

Type LC

Westinghouse Electric Corporation
Specialty Transformer Division: Greenville, Pa.
Printed in USA

## application

Type SC transformers provide stepped-down voltages to control devices and enable control circuits to be isolated from all power and lighting circuits, thus allowing the use of grounded or ungrounded circuits that are independent of the power or lighting grounds. The SC line is particularly adaptable on applications where compact construction is demanded. Its dimensions and configurations are such that it will fit standard motor starter boxes. Electrical performance equals or exceeds N.E.M.A., J.I.C. and N.M.T.B.A. standards.

Westinghouse

## Saturable Core Inductors

Type SCI, Group II Insulation
Air Insulated, 60 Cycles, $80^{\circ} \mathrm{C}$ Rise Single Phase, 600 Volts and Below

List Prices: 3 Thru 15 Kva
The prices shown below cover single phase, 60 cycle apparatus only, with ac voltages of $600,380,480,277,240,138,120$ and 69 volts. Where reactors are to be used on three phase systems, three single phase units should be ordered. For three phase applications, inductors must be supplied with ac windings rated for line to neutral volts, whether the load is wye or delta connected. Dc control voltages are 26, 60 and 85. For saturable core inductors 25 kva and below, Westinghouse does not supply magnetic amplifier units or drivers.

| Kva Rating of Load (1) | Ac Losses at Full Load | List Price |  |
| :---: | :---: | :---: | :---: |

| 5 | 110 | 234 | 210 |
| 71/2 | 135 | 292 | 264 |
| 10 | 175 | 344 | 310 |
| 15 | 230 | 444 | 400 |
| 25 | 335 | 653 | 588 |

(1) Capacities cannot be exceeded. There can be no interpolation of prices. If capacity required exceeds listed rating select next highest size for prices.

## Ordering Information

Specify the following when ordering SCl inductors:

1. Number of units.
2. Ac systems voltage and frequency.
3. Available d-c supply voltage.
4. Kva rating.
5. Nature of load and circuit to be controlled.

Further Information:
Description: DB 46-853

## Saturable Core Inductors

## Type SCI, Group II Insulation

Air Insulated, 60 Cycles, $80^{\circ}$ C Rise Single Phase, 600 Volts and Below

Westinghouse

Type AP Machine Tool Transformer

## Application

Type AP transformers provide stepped-down voltages to machine tool control devices enabling control circuits to be isolated from all power and lighting circuits, thus allowing the use of grounded or ungrounded circuits that are independent of the power or lighting grounds. Greater safety is afforded the operator and the more rugged 115 -volt coils can be used on the control devices regardless of the line voltage. The AP line is particularly adaptable on applications where compact construction is demanded.

Air insulated and cooled by the natural convection of air, these transformers are safe and cannot explode, no toxic gases can be released, and fire hazards are negligible. Elimination of these potential hazards also makes them desirable for installation in hospitals, hotels, theaters, schools, factories, and other working areas where large groups of people are present.

Where space limitations and insurance regulations prohibit the use of liquid-filled transformers, the dry type transformer is the answer.

## Design Features

Totally enclosed construction.
Smaller than open core and coil units. Sound levels lower than standard.
Highest testing standards in the industry.
Meet or exceed NEMA performance requirements.
Screw type terminal boards.

## List Prices

240/480 to 120/240 Volts, 60 Cycles.

|  | 6F203 | 260 |

## Control Transformers <br> Type AP Machine Tool

$240 / 480$ to $120 / 240$ Volts
60 Cycles, Single Phase

The purpose of the regulation curves shown is to indicate the volt-amperes which may be taken from the transformer secondary at various power factors and still maintain $95 \%$ of the rated secondary voltage. Since most magnetic devices will operate at $85 \%$ of rated voltage (NEMA Standard), this provides a safety factor of $10 \%$ for undervoltage on the primary.

To use the curves:

1. Vectorially add the maximum inrush voltamperes to the continuous volt-amperes connected to the transformer.
2. Determine the power factor of the above condition.

For most solenoids, contactors and similar magnetic devices, $20 \%$ is a reasonable value to use. For motor starting, $50 \%$ to $60 \%$ is a reasonable value.
3. Locate the point determined by steps 1 and 2 on the proper graph. Choose the transformer rating whose curve is next above this point. In cases where the point falls slightly above a curve, the safety factor previously mentioned will allow the user to pick the next lower rating if the primary voltage is close to nominal.

## Type SW Transformers

Westinghouse

## Specialty Transformers

## Network Power Filter

Transient and surge voltages in the output voltage waveform of a computer power supply may cause erratic operation and /or failure of certain of the semiconductor or solid state components of the computer.
The NPF limits the magnitude of transient and surge voltages in the output of the transformer.
Therefore, it would be desirable to provide a NPF and improve three phase AC power supply for electronic apparatus, such as computers, which will provide complete protection for the connected apparatus against surge and transient voltage.
Line-to-line voltage clamping means, by itself, is not sufficient protection for the output voltage of a three-phase power supply, and that line-to-neutral voltage clamping means, by itself, is also not sufficient protection. Both types of protection are required, in order to protect against substantially in-phase line-toneutral transient voltages, as well as unbalanced transient voltages. Further clamping the line-to-line and line-to-neutral voltage of a three-phase power supply provides only partial protection for the connected load. Short duration surge voltages having an extremely fast rise and fall time, but a magnitude less than the clamping magnitude, are equally inimical to the solid state devices, as they have a maximum time rate of change voltage rating, which if exceeded will cause them to fail. Further, the short duration, fast rise time voltage pulses are transmitted through the capacitance between the primary and secondary windings of the step-down transformer of the three-phase power supply without transformation, as well as through additional step-down transformers in the connected apparatus for providing the relatively small magnitude control voltages required by certain semiconductor devices. Thus, while these surge voltages may be a relatively small fraction of the magnitude of the distribution voltage of the electrical utility, and may be below the magnitude of the clamping voltage in the three-phase power supply, they may be several times the maximum operating voltage of the semiconductor devices after passing through all of the step-down transformers between the source of the surge potential and the semiconductor devices, since they are not subject to the step-down ratios of the transformers. This device is a new and improved three-

Keep all Leads as Short as Possible
phase AC power supply, which provides complete protection against all of the transient and surge phenomena revealed in the hereinbefore enumerated understanding of their natures. A transient voltage filter is connected to the secondary winding, which includes capacitors connected line-to-neutral, and voltage clamping means applied line-to-neutral, and line-toline. The capacitors and voltage clamping means cooperate to provide complete transient and surge voltage protection for the connected load, with the capacitors absorbing and smoothing the fast rise time, short duration pulses, and the voltage clamping means absorbing the relatively long time transients having higher magnitudes. ${ }^{\circledR}$
