

Single-Phase Step

GENERAL

McGraw-Edison® VR-32 single-phase step voltage regulators are tap-changing autotransformers. They regulate distribution line voltages from 10% raise (boost) to 10% lower (buck) in thirty-two steps of approximately 5/8% each. Voltage ratings are available from 2400 volts (60 kV BIL) to 34,500 volts (200 kV BIL) for 60 Hz and 50 Hz systems.

Internal potential winding taps and an external ratio correction transformer are provided on all ratings so that each regulator may be applied to more than one system voltage.

Smaller kVA sizes are supplied with support lugs for pole mounting and with substation or platform tie down provisions. Larger sizes are provided with substation bases with pad-mounting provisions.

Voltage is maintained within desired limits by controls that feature superior accuracy, reliability, and serviceability. Continuity of service is assured by rugged, service-proven tap changers and core-and-coil assemblies functioning with the control.

McGraw-Edison voltage regulators are available with a full complement of standard features for routine applications, as well as a full line of optional accessories for unique applications. In addition, the regulator offers desirable features that enhance operation and service.

STANDARD FEATURES

A sealed-tank construction allows the use of 65°C rise insulation system in 55°C rise rated designs to provide an additional 12% capacity above the nameplate rating without loss of normal insulation life. Additional load capacity is stated on the nameplate, this ADD-AMP™ feature is available as long as the tap changer's maximum current rating is not exceeded.

The unit construction cover suspends the internal assembly consisting of the core-and-coil assembly, tap changer, and the reactor for ease of inspection and maintenance.

Figure 1.
VR-32 Voltage Regulator with CL-5C control.

All McGraw-Edison regulators are manufactured and tested to the ANSI Standard C57.15.

Figure 2.
VR-32 Voltage Regulator.

STANDARD FEATURES

- CL-2A control
- Tap changer with motor and power supply
- Position indicator with ADD-AMP adjustment
- Two laser-etched nameplates
- Lifting lugs
- Oil drain valve and sampling device
- Upper filter press connection
- Oil sight gauge
- Mounting provisions for shunt arresters
- High-creep bushings with clamp-type terminals
- Bolt-down provisions (overhead units)
- Pole-type mounting brackets (overhead units)
- Substation base (substation units)
- External series arrester
- Automatic pressure relief device
- Handhole
- Control cabinet with removable front panel
- Ratio correction transformer
- Conformally coated circuit boards

OPTIONAL ACCESSORIES

- Shunt arresters
- Extra-length control cables
- Elevating structure
- Control heater
- 4-hole NEMA H-spades
- Cooling fans
- Data reader
- Nameplates in alternate languages or metric units
- 240 volt external source
- Internal differential potential transformer for complete reverse power flow w/metering (requires CL-5C control)
- CL-5C control (optional accessories for control listed below)
 - SCADA relay
 - Fiber optic interface board (for digital communication)
 - CL-Interface program

ARRESTERS

Series Surge Arresters

All VR-32 Voltage Regulators are equipped with a bypass arrester connected across the series winding between the source (S) and load (L) bushings. This bypass arrester limits the voltage developed across the series winding during lightning strikes, switching surges and line faults. A MOV type series surge arrester of 3 kV offers series winding protection on all regulators except those rated 33000 V, which have a 6 kV MOV-type series surge arrester.

Shunt Arresters

A shunt arrester is an optional accessory on the VR-32 Voltage Regulator for protection of the shunt winding. The shunt arrester is a direct connected arrester mounted on the tank and is connected between the load bushing and ground. For additional protection, a shunt arrester may also be installed between the source bushing and ground. Shunt arrester application data is listed in Table 1.

TABLE 1

CONTROLS

CL-2A

- Internal-external voltage source switch
- Automatic/manual control switch
- Manual raise/lower toggle switch
- Position indicator drag hand reset switch
- Neutral indicating light
- Six-digit operations counter
- Panel-mounted fuses
- Band edge indicators
- Voltage test terminals
- External voltage source terminals
- Control knob locking devices
- Set voltage adjustment
- Bandwidth adjustment
- Time delay adjustment
- Line drop compensator settings
- Resistance and reactance reverse polarity switch
- Provisions to allow remote override of regulator operation via discrete (analog) supervisory control

CL-5C

- Source side voltage calculated from tap position
- Internal-external voltage source switch
- Automatic/manual control switch
- Manual raise/lower toggle switch
- Position indicator drag hand reset switch
- Supervisory ON-OFF switch (for use with SCADA)
- Neutral indicating light
- Six-digit operations counter
- Panel-mounted fuses
- Band edge indicators
- Voltage test terminals
- External voltage source terminals
- Set voltage adjustment
- Bandwidth adjustment
- Time delay adjustment
- Line drop compensator settings
- Resistance and reactance reverse polarity switch
- Digital metering package (including instantaneous, demand, and time-tagged demand)
- Profile recorder
- Tap position indication tracking capability
- Voltage limiting ("First house protection")
- Voltage reduction with 3 modes
- Reverse power flow detection
- Provisions to allow remote override of regulator operation via discrete (analog) supervisory control
- Digital communications capability
- Resident communications protocol (DATA 2179)
- Data port for data reader or personal computer attachment

CONSTRUCTION

Core and Coil Assembly

Ease of service is provided by the design of the core-and-coil, tap changer, and reactor assembly. The entire assembly is cover suspended for ease of removal from the tank for inspection or maintenance.

The coil assembly features an aluminum strip in the series winding that achieves the optimum in ampere turn balance for exceptional strength under through-fault conditions.

Grain-oriented steel is used in the core, with a low reluctance butt joint. The rugged core clamp assembly secures the coil effectively and positions the core for the optimum in quiet operation and low core loss.

With sealed-tank construction, the external oxygen supply is eliminated from the tank environment. With the use of a 65°C rise insulation system and designs with a nameplate rating of 55°C, an additional 12 percent capacity is available from the McGraw-Edison 32-step regulator without any loss of insulation life.

Figure 3.
Core and coil, tap changer and reactor assembly.

Tap Changers

Spring-drive tap changers are typically used in regulators rated below 15 kV, 219 A and below; and units rated 19.92 kV, 100.4 A and below. A spring-drive tap changer is shown in Figure 4. In the larger sizes, the tap change is accomplished by a direct-drive mechanism. A direct-drive tap changer is shown in Figure 5. Smooth tap changes and long contact life are assured through careful design of speed controlling components.

Figure 4.
Spring-drive tap changer.

Figure 5.
Direct-drive tap changer.

Position Indicator and ADD-AMP Capability

The position indicator is mounted on a junction box on the cover of the regulator, and is directly connected to the tap changer by a flexible drive shaft passing through the junction box and terminal board via a sealing gland.

The indicator face is graduated in steps, numbered 1 through 16 on each side of zero. Zero designates neutral. Drag hands indicate the maximum and minimum positions attained during raise and lower operations. The drag hands are reset around the position indicator hand by operating the drag hand reset switch on the control front panel.

The ADD-AMP feature of VR-32 regulators allows increased current capacity by reducing the regulation range. This is accomplished by setting limit switches in the position indicator to prevent the tap changer from traveling beyond a set position, in either raise or lower directions. The limit switches have scales graduated in percent regulation, and are adjustable to specific values of 5, 6-1/4, 7-1/2, 8-3/4, and 10% regulation to alter the regulation range. The five possible load current ratings associated with the reduced regulation ranges are summarized in Tables 4 and 5. At each setting, a detent stop provides positive adjustment. Settings other than those with stops are not recommended. The raise and lower limits need not be the same value unless reverse power is possible.

¹ Additional 12% increase in capacity is available due to the use of 65° C winding rise insulation if the tap changer's maximum current rating has not been exceeded. For loading in excess of the above values please contact Cooper Power Systems customer service.

² Regulators are capable of carrying current corresponding to rated kVA when operated at 7200 volts.
